

Apache Cordova Framework

Developer's Guide

Content

1. Installation of required software.
2. Create your first Cordova app.
3. Converting Website to Mobile App.
4. Running Cordova Application.

1. Installation of Required software

Installing the Requirements

Java Development Kit (JDK)

Install [Java Development Kit \(JDK\) 8](#) or you may download the lower version [here](#).

When installing on Windows you also need to set JAVA_HOME Environment Variable according to your JDK installation path (see [Setting Environment Variables](#))

Gradle

As of Cordova-Android 6.4.0, [Gradle](#) is now required to be installed to build Android.

When installing on Windows, you need to add Gradle to your path, (see [Setting Environment Variables](#))

Android SDK

Install [Android Studio](#). Follow the instructions at the linked Android Developer site to get started. Opening Android Studio for the first time will guide you through the process of installing the Android SDK.

Node.js®

Install [Node.js®](#). Follow the instruction on how to install Node.js® by clicking this [link](#).

Apache Cordova

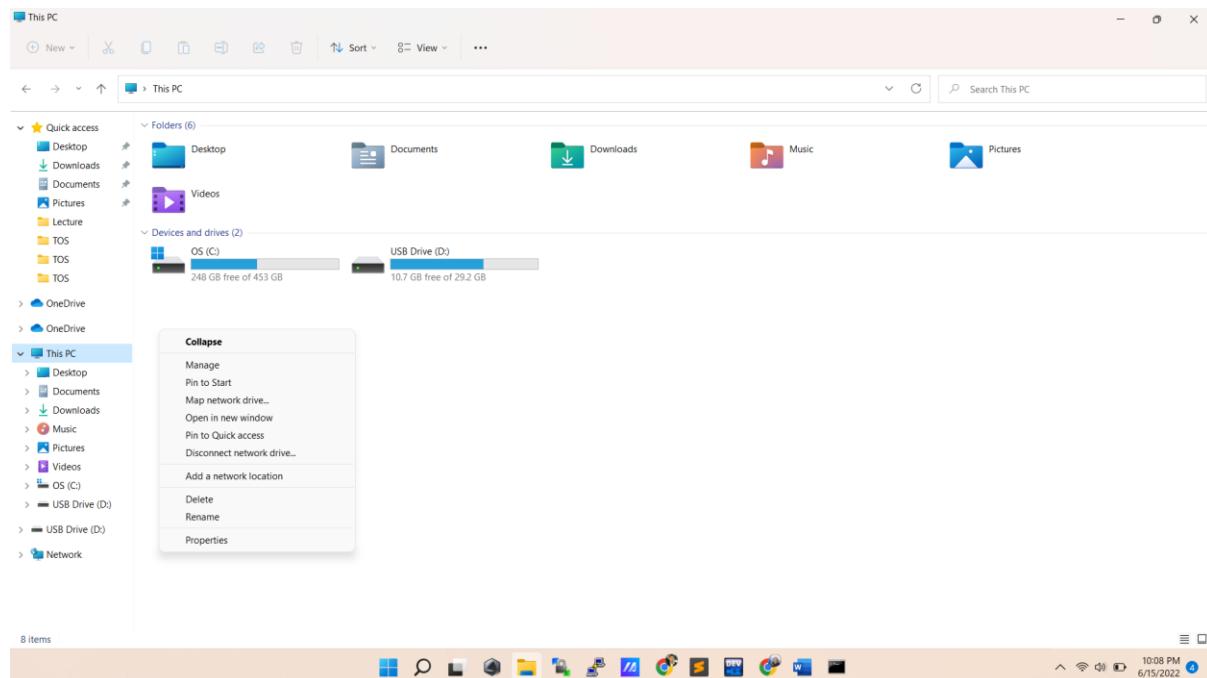

Install the Cordova CLI. Cordova is installed using the Node Package Manager (npm). Type the following in the command window to install:

```
npm install -g cordova
```

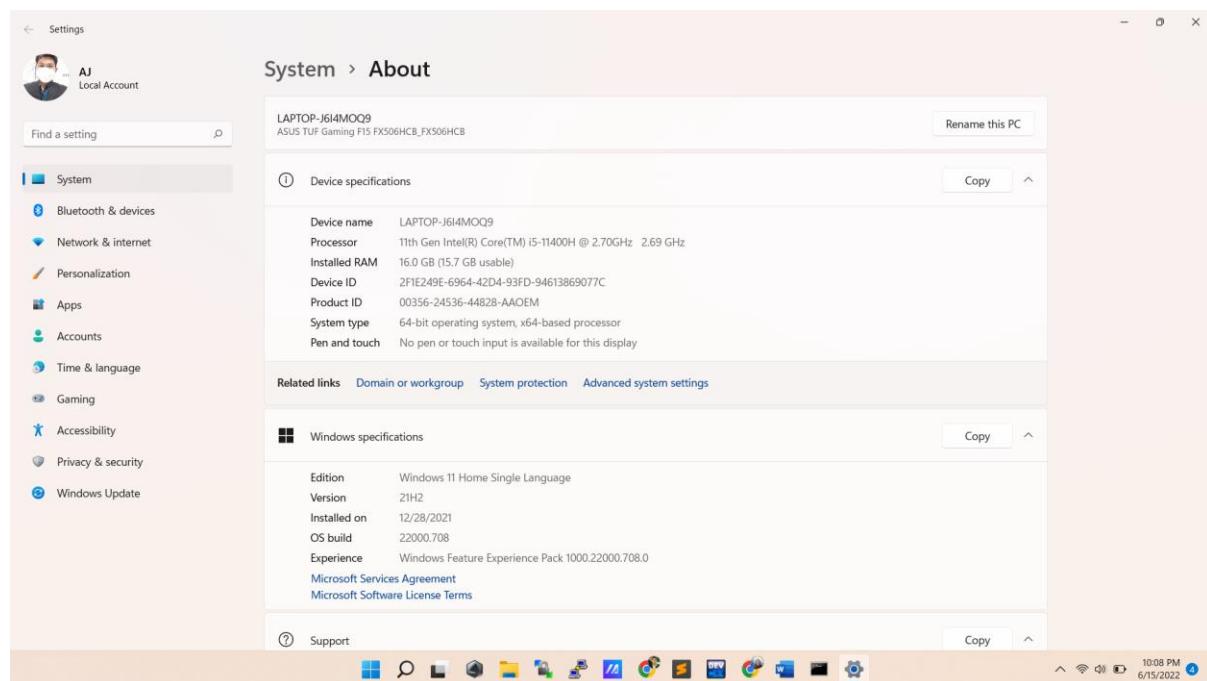

You can follow the instruction to setup apache cordova [here](#).

Java Development Kit (JDK) – Setting Environment Variables

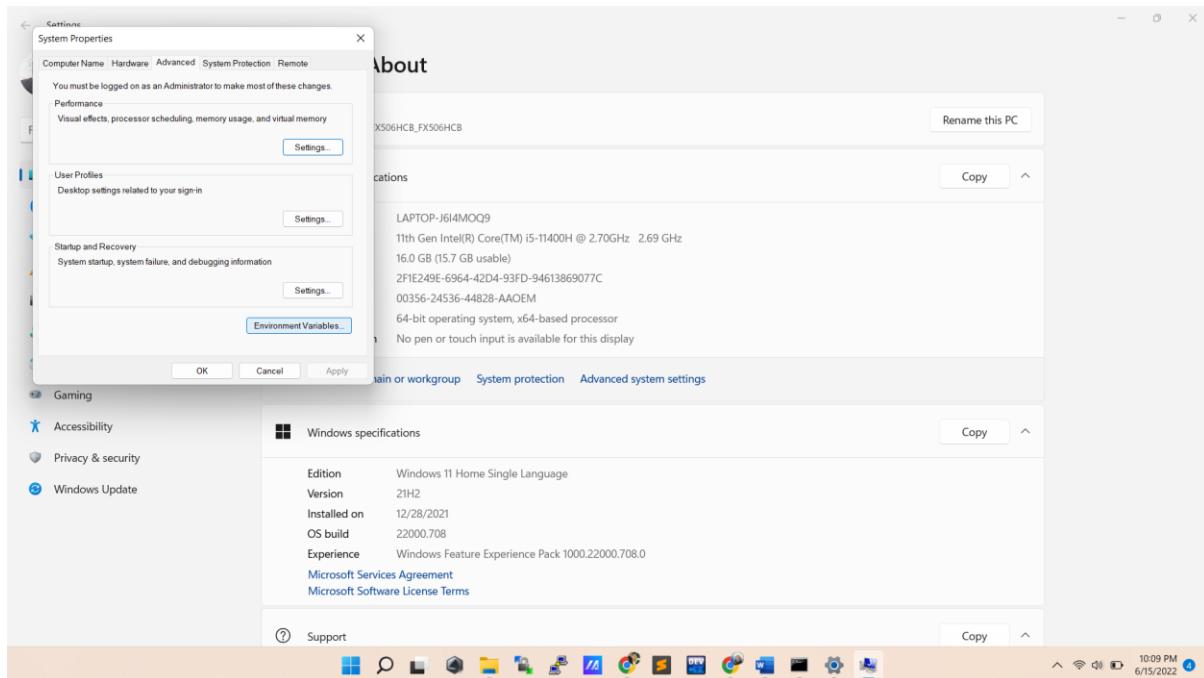

1. Right-click “This PC” and find “Properties”.

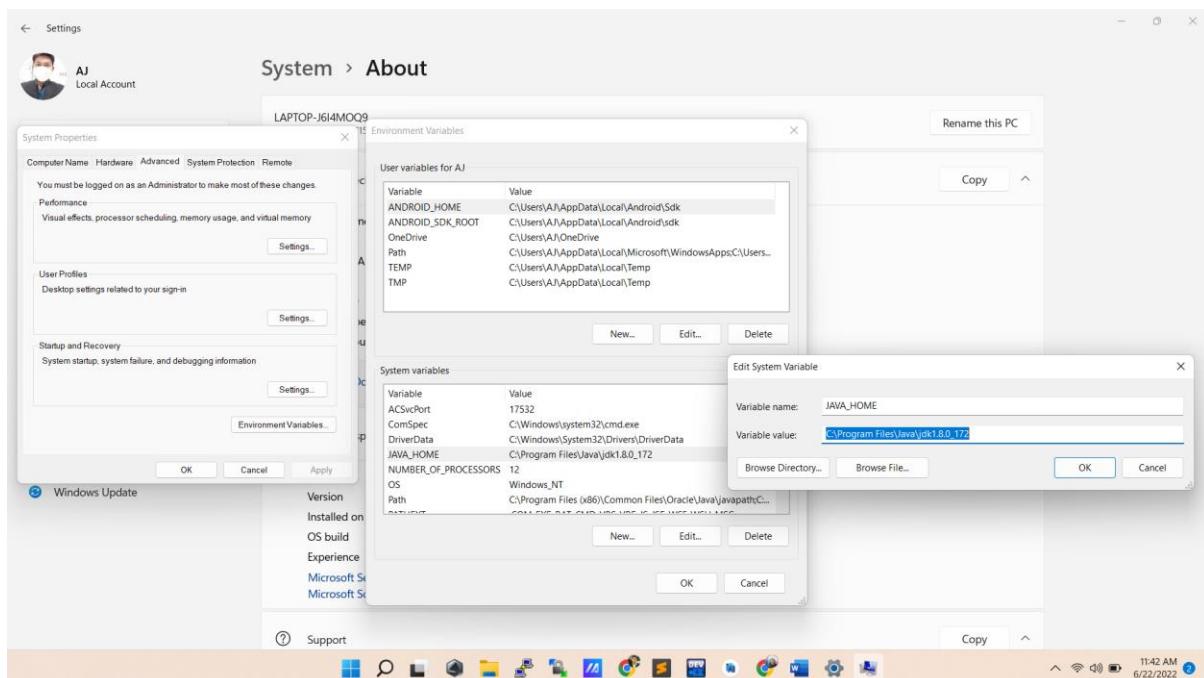

2. Find / Click “Advance system settings”.

3. Find / Click “Environment Variables”.

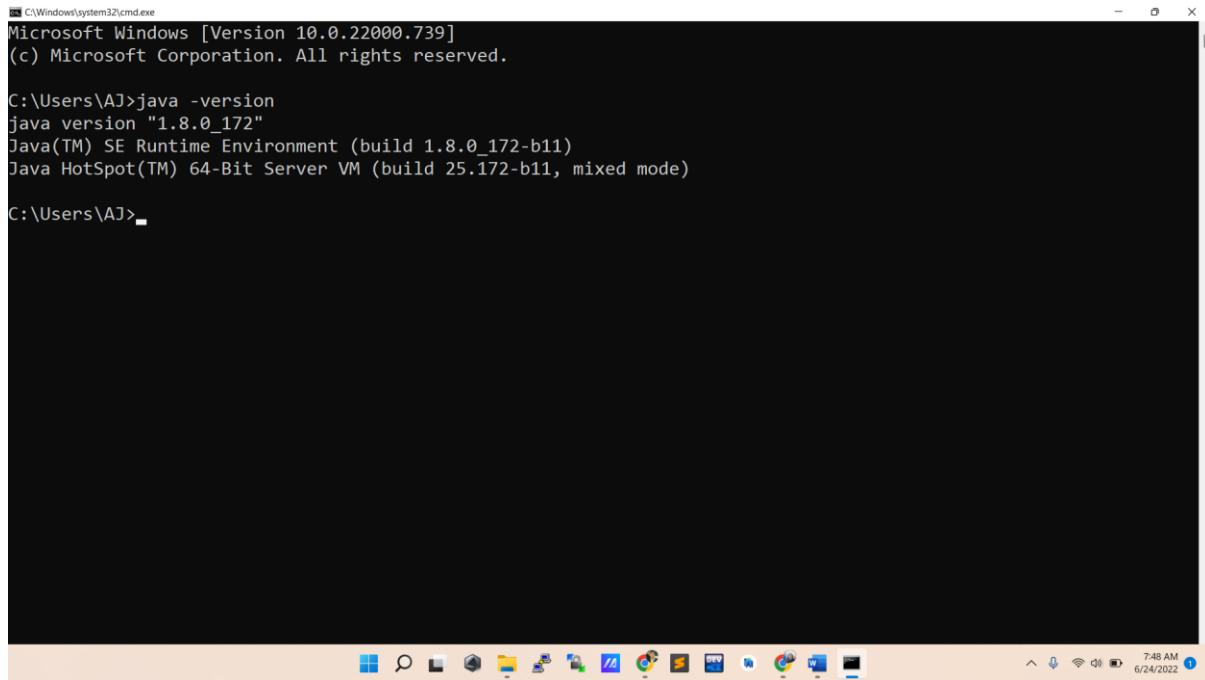

4. Set the JAVA_HOME environment variable to the location of your JDK installation. Under “System Variables”, click “New” and type “JAVA_HOME” as the environment variable name and the location of your JDK installation as a value.

5. Verify your installation

Open a console (or a Windows command prompt) and run java -version to run java and display the version, e.g.:

```
C:\Windows\system32\cmd.exe
Microsoft Windows [Version 10.0.22000.739]
(c) Microsoft Corporation. All rights reserved.

C:\Users\AJ>java -version
java version "1.8.0_172"
Java(TM) SE Runtime Environment (build 1.8.0_172-b11)
Java HotSpot(TM) 64-Bit Server VM (build 25.172-b11, mixed mode)

C:\Users\AJ>
```

Gradle – Setting Environment Variables

Installing manually

Step 1. Download the latest Gradle distribution

The current Gradle release is version 7.4.2, released on 31 Mar 2022. The distribution zip file comes in two flavors:

- [Binary-only](#)
- [Complete](#), with docs and sources

If in doubt, choose the binary-only version and browse [docs](#) and [sources](#) online.

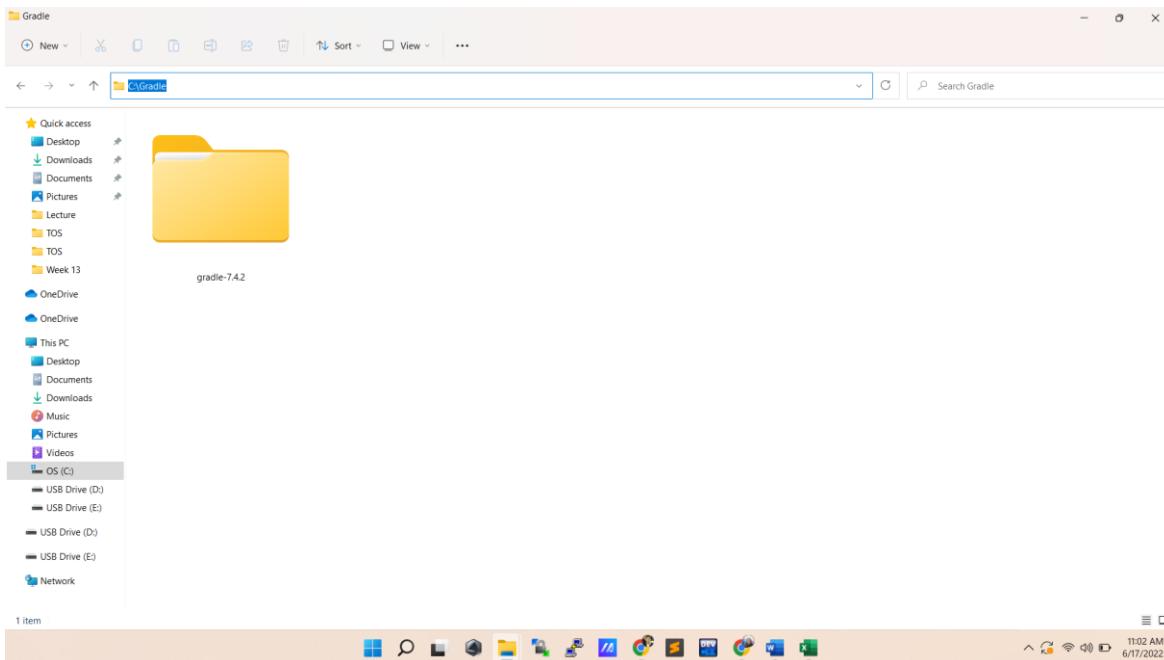

Need to work with an older version? See the [releases page](#).

Step 2. Unpack the distribution

Microsoft Windows users

Create a new directory **C:\Gradle** with File Explorer.

Open a second File Explorer window and go to the directory where the Gradle distribution was downloaded. Double-click the ZIP archive to expose the content. Drag the content folder **gradle-7.4.2** to your newly created **C:\Gradle** folder.

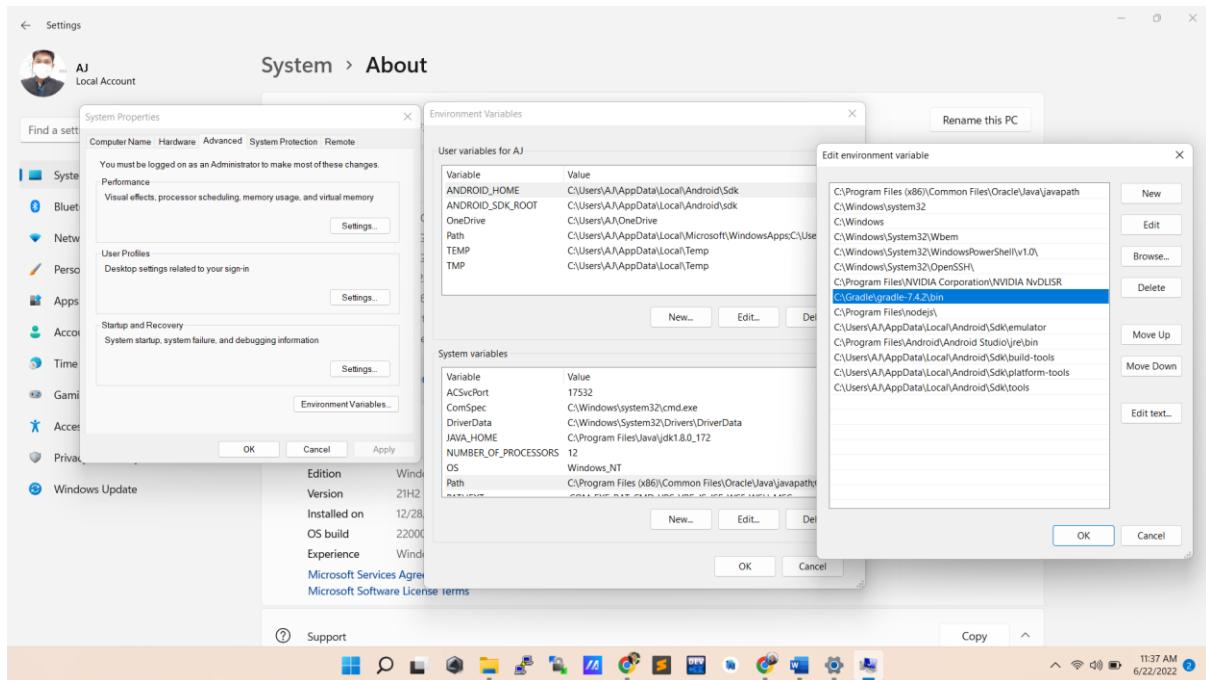

Alternatively you can unpack the Gradle distribution ZIP into **C:\Gradle** using an archiver tool of your choice.

Step 3. Configure your system environment

Microsoft Windows users

In File Explorer right-click on the **This PC** (or **Computer**) icon, then click **Properties** -> **Advanced System Settings** -> **Environmental Variables**.

Under **System Variables** select **Path**, then click **Edit**. Add an entry for **C:\Gradle\gradle-7.4.2\bin**. Click **OK** to save.

Step 4. Verify your installation

Open a console (or a Windows command prompt) and run `gradle -v` to run gradle and display the version, e.g.:

```
$ gradle -v
```

```
-----
Gradle 7.4.2
-----
```

For complete details about setting environment variables for gradle, click [here](#).

Android (SDK)

Setting Environment Variables

Cordova's CLI tools require some environment variables to be set in order to function correctly. The CLI will attempt to set these variables for you, but in certain cases you may need to set them manually. The following variables should be updated:

1. Set the `ANDROID_SDK_ROOT` environment variable to the location of your Android SDK installation.
2. It is also recommended that you add the Android SDK's `cmdline-tools/latest/bin`, `emulator` and `platform-tools` directories to your `PATH`
3. For `apksigner` and `zipalign`, the Android SDK's `build-tools` must also be added to your `PATH`.

Windows

These steps may vary depending on your installed version of Windows. Close and reopen any command prompt windows after making changes to see them reflected.

1. Click on the **Start** menu in the lower-left corner of the desktop
2. In the search bar, search for **Environment Variables** and select **Edit the system Environment Variables** from the options that appear
3. In the window that appears, click the **Environment Variables** button

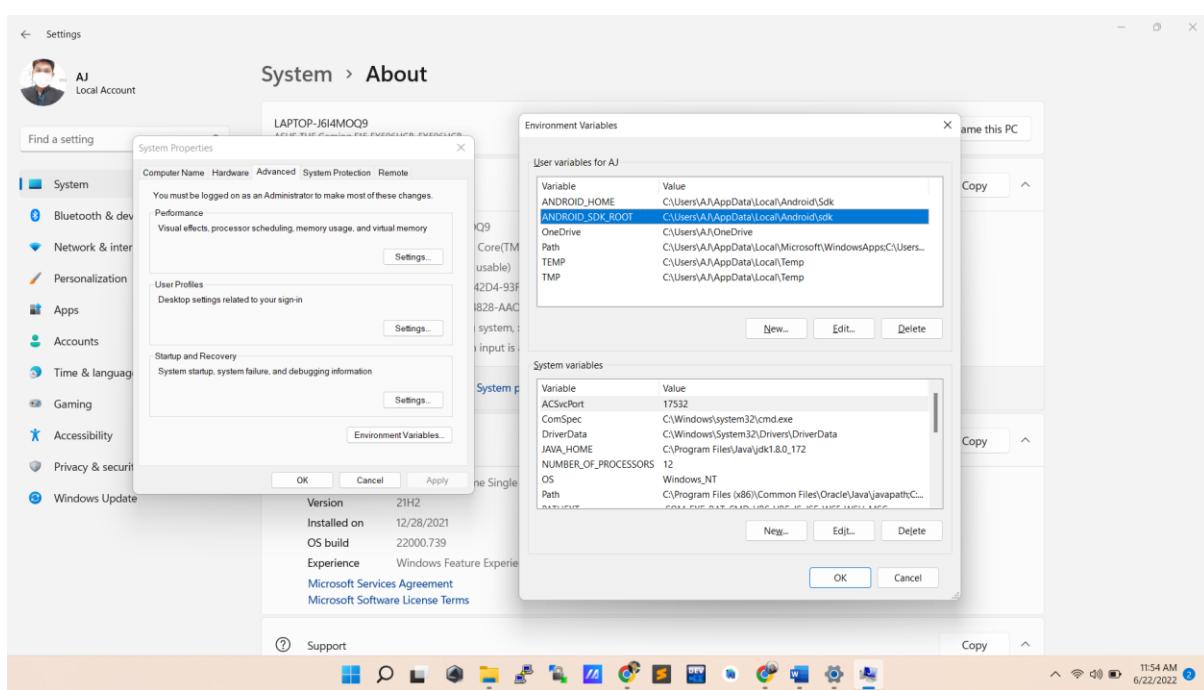

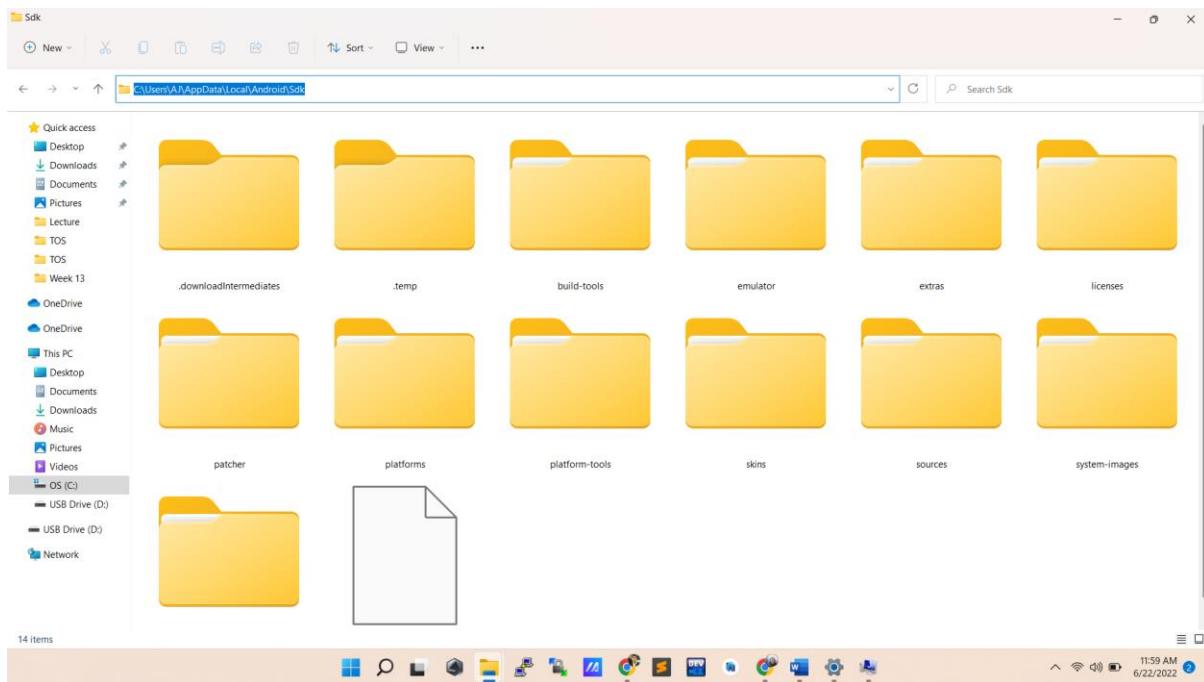

To create a new environment variable:

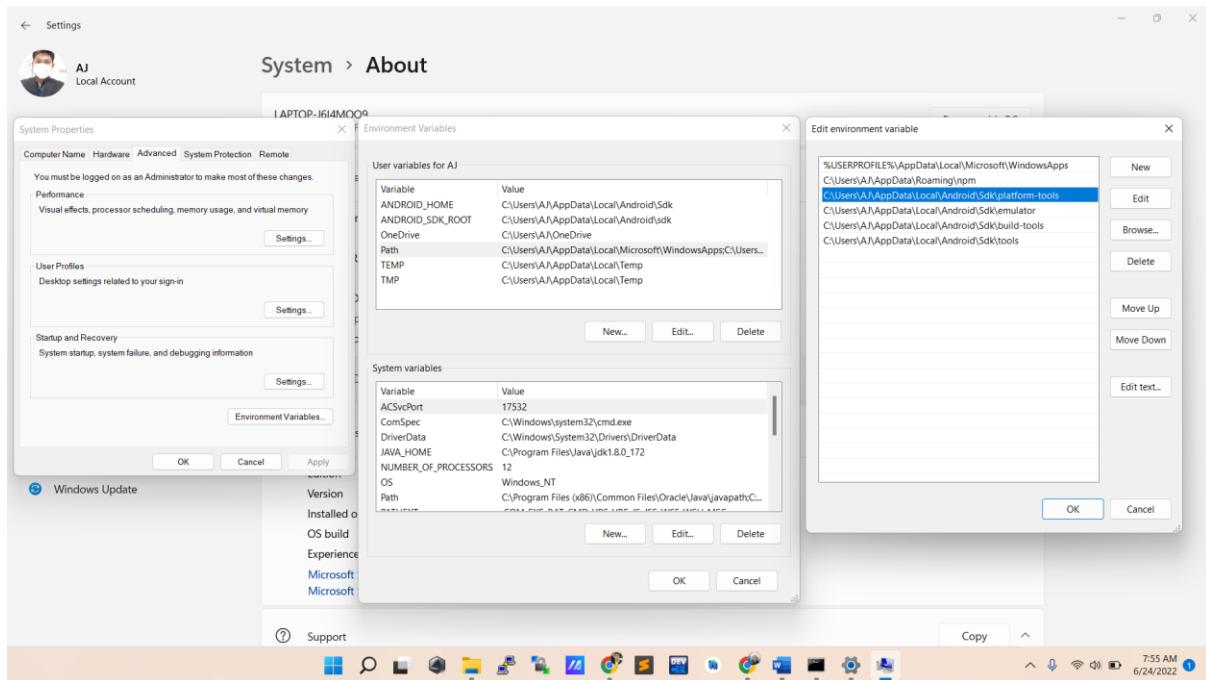

1. Click **New...** and enter the variable name and value

To set your PATH:

1. Select the **PATH** variable and press **Edit**.
2. Add entries for the relevant locations to the **PATH**. For example (substitute the paths with your local Android SDK installation's location):

```
C:\Users\[your user]\AppData\Local\Android\Sdk\platform-tools  
C:\Users\[your user]\AppData\Local\Android\Sdk\cmdline-tools\latest\bin  
C:\Users\[your user]\AppData\Local\Android\Sdk\tools\emulator
```

For complete details about setting environment variables for Android, click [here](#).

Adding SDK Packages

After installing the Android SDK, you must also install the packages for whatever [API level](#) you wish to target. It is recommended that you install the highest SDK version that your version of cordova-android supports (see [Requirements and Support](#)).

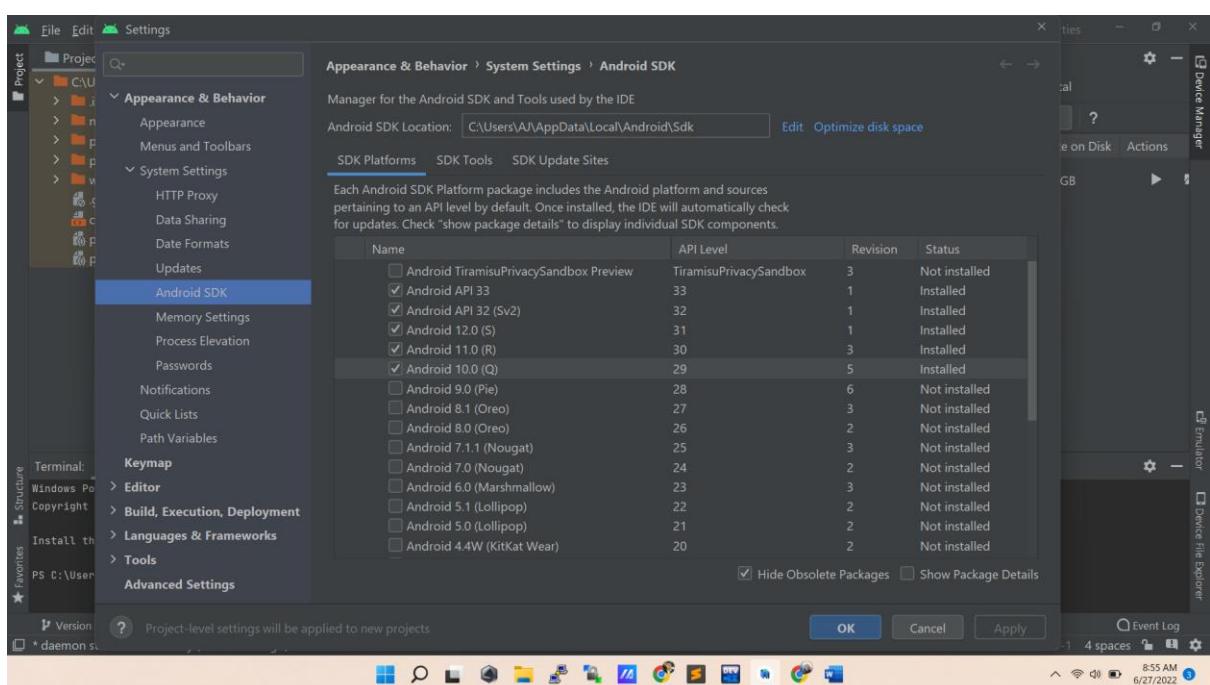

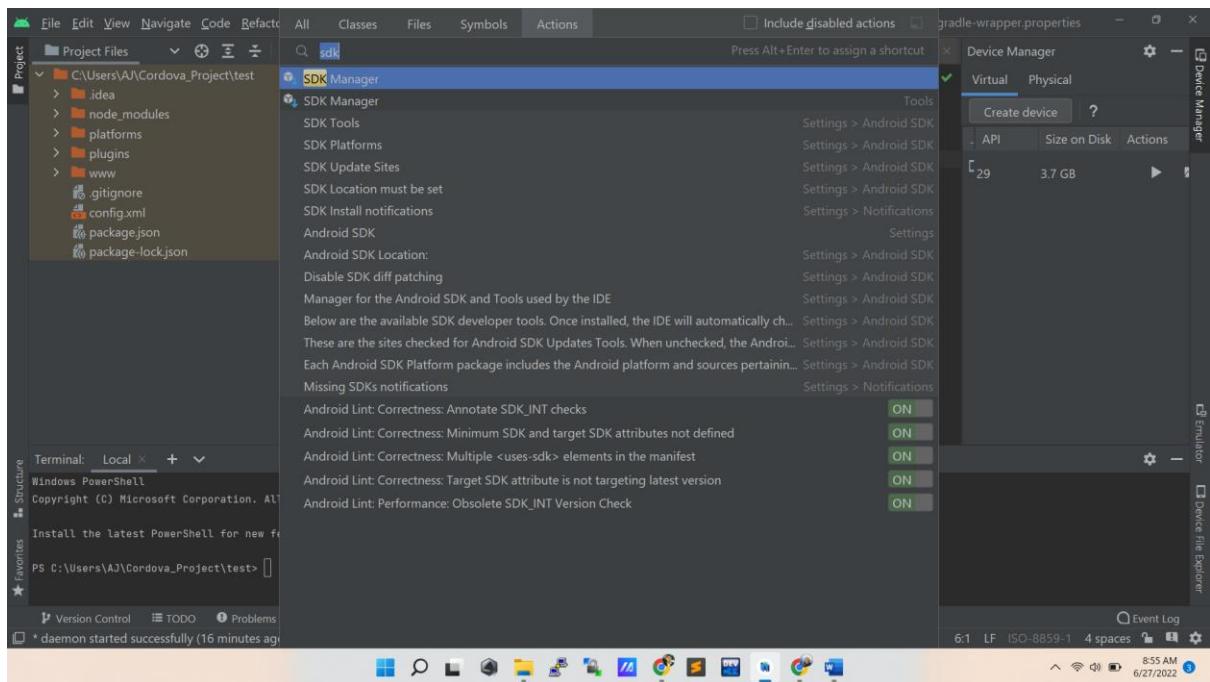

Open the Android SDK Manager ([Tools > SDK Manager](#) in Android Studio, or `sdkmanager` on the command line), and make sure the following are installed:

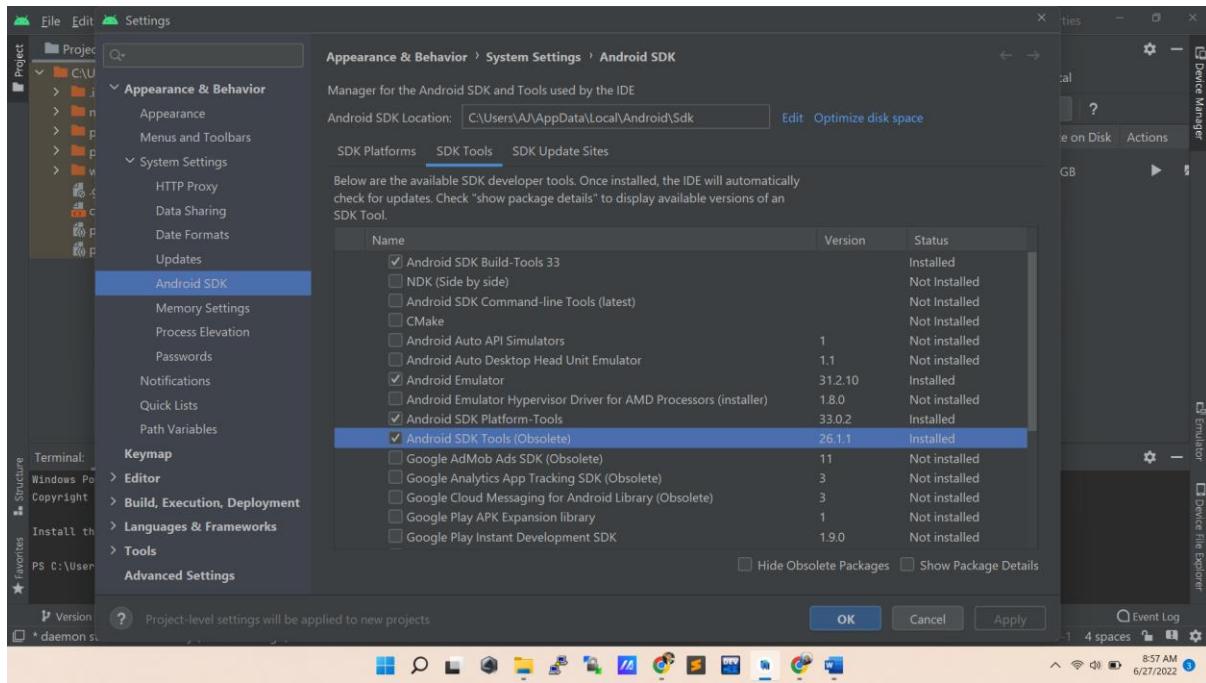

1. Android Platform SDK for your targeted version of Android
2. Android SDK build-tools version 29.0.2 or higher

[Android SDK Tools:](#)

In Android Studio 3.6 or later, you need to manually add the old version of the Android SDK Tools. To do this:

1. Open the Android Studio **SDK Manager**
2. In the Android **SDK Tools** tab, uncheck **Hide Obsolete Packages**
3. Check **Android SDK Tools (Obsolete)**

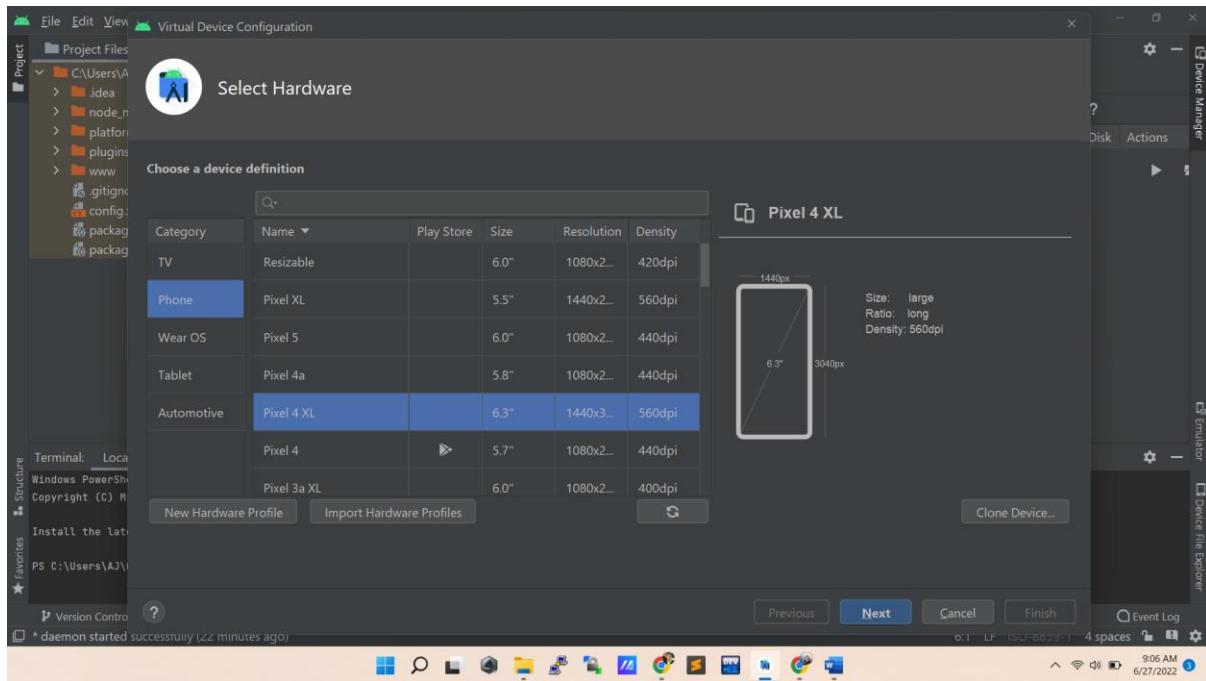

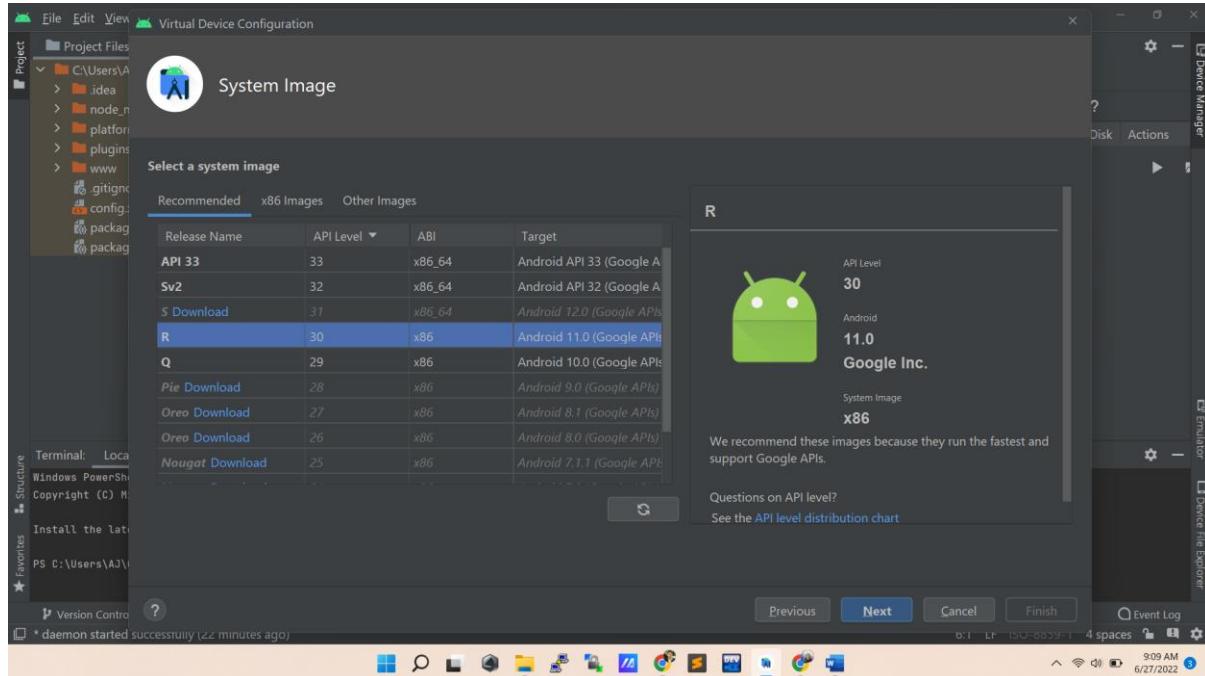

See Android's documentation on [Installing SDK Packages](#) for more details.

Virtual Device Configuration (Device Manager)

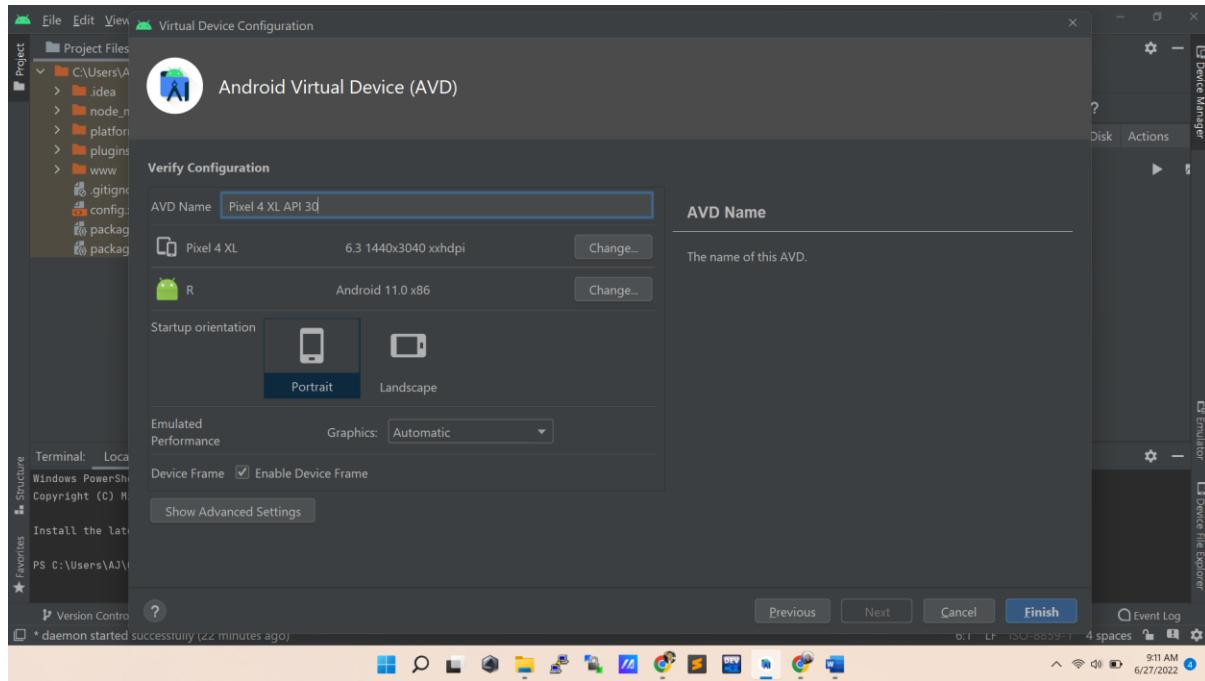

1. Choose a device definition
2. Select “Phone” as a hardware in the category including the size and resolution of your target device.

3. Select a system image. Download from recommended API Level. Example: Android 11.00.

4. Verify Configuration. Type in your chosen AVD Name and hit finish.

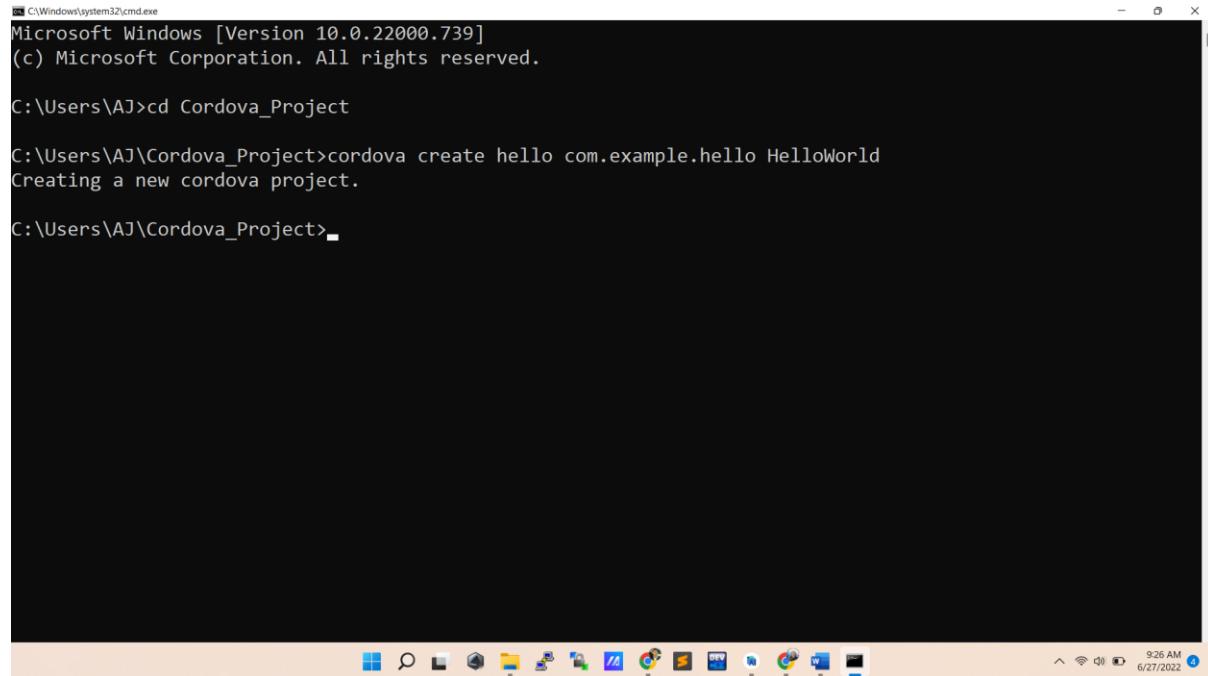

2. Create your first Cordova app

Create the App

Go to the directory where you maintain your source code, and create a cordova project:

```
$ cordova create hello com.example.hello HelloWorld
```

The screenshot shows a Windows Command Prompt window titled 'C:\Windows\system32\cmd.exe'. The window displays the following command and its output:

```
Microsoft Windows [Version 10.0.22000.739]
(c) Microsoft Corporation. All rights reserved.

C:\Users\AJ>cd Cordova_Project
C:\Users\AJ\Cordova_Project>cordova create hello com.example.hello HelloWorld
Creating a new cordova project.

C:\Users\AJ\Cordova_Project>
```

The command 'cordova create hello com.example.hello HelloWorld' was run to create a new Cordova project named 'HelloWorld' with the package name 'com.example.hello'. The project directory 'HelloWorld' was created in the current working directory 'C:\Users\AJ\Cordova_Project'.

This creates the required directory structure for your cordova app. By default, the `cordova create` script generates a skeletal web-based application whose home page is the project's `www/index.html` file.

Add Platforms

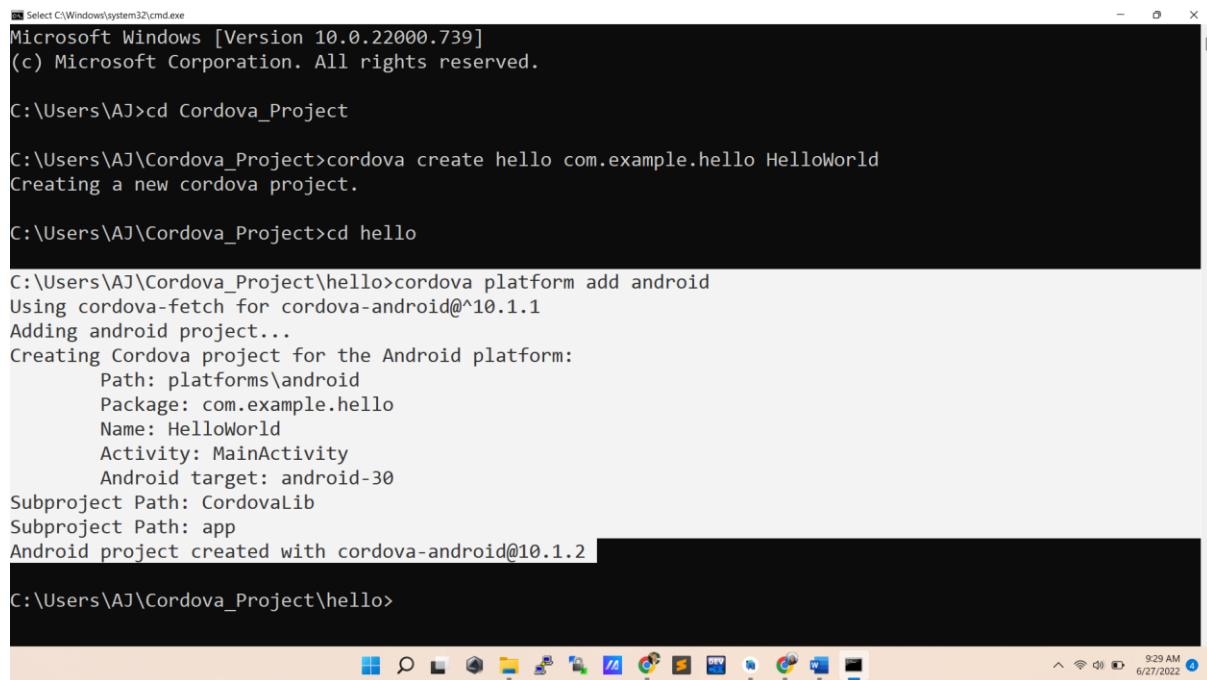

All subsequent commands need to be run within the project's directory, or any subdirectories:

```
$ cd hello
```

Add the platforms that you want to target your app. We will add the 'ios' and 'android' platform and ensure they get saved to `config.xml` and `package.json`:

```
$ cordova platform add ios
```

```
$ cordova platform add android
```

```
Microsoft Windows [Version 10.0.22000.739]
(c) Microsoft Corporation. All rights reserved.

C:\Users\AJ>cd Cordova_Project

C:\Users\AJ\Cordova_Project>cordova create hello com.example.hello HelloWorld
Creating a new cordova project.

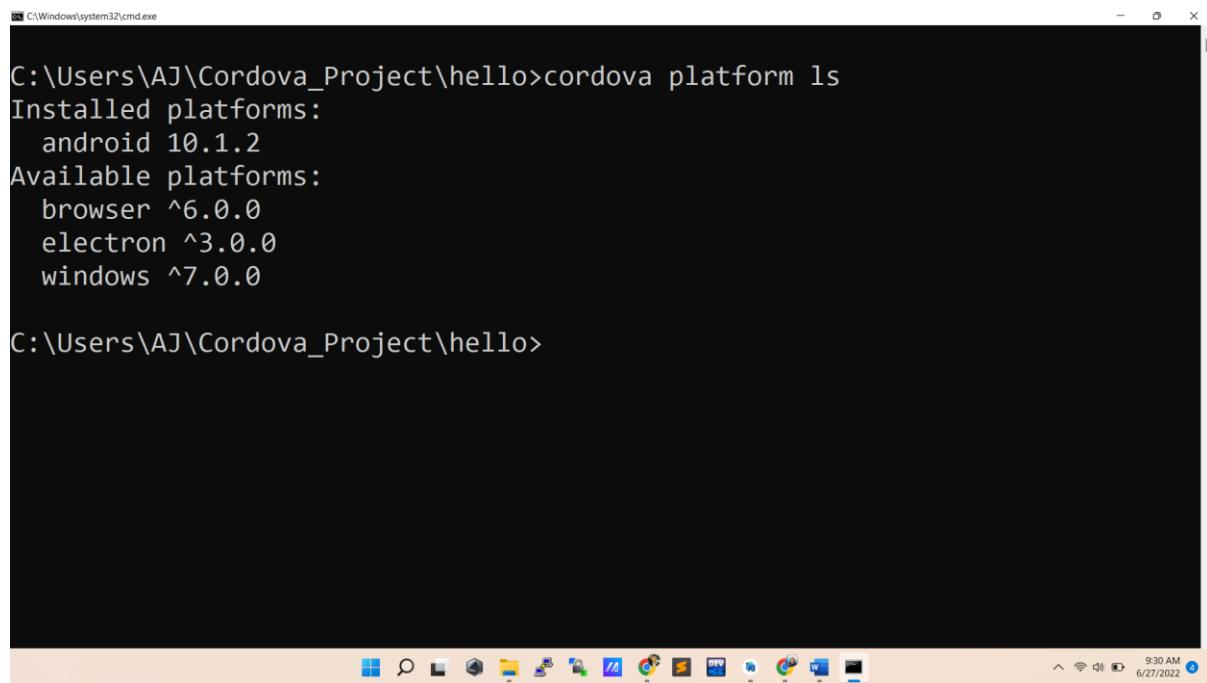

C:\Users\AJ\Cordova_Project>cd hello

C:\Users\AJ\Cordova_Project\hello>cordova platform add android
Using cordova-fetch for cordova-android@^10.1.1
Adding android project...
Creating Cordova project for the Android platform:
  Path: platforms\android
  Package: com.example.hello
  Name: HelloWorld
  Activity: MainActivity
  Android target: android-30
Subproject Path: CordovaLib
Subproject Path: app
Android project created with cordova-android@10.1.2

C:\Users\AJ\Cordova_Project\hello>
```

To check your current set of platforms:

```
$ cordova platform ls
```

```
C:\Windows\system32\cmd.exe

C:\Users\AJ\Cordova_Project\hello>cordova platform ls
Installed platforms:
  android 10.1.2
Available platforms:
  browser ^6.0.0
  electron ^3.0.0
  windows ^7.0.0

C:\Users\AJ\Cordova_Project\hello>
```

Running commands to add or remove platforms affects the contents of the project's *platforms* directory, where each specified platform appears as a subdirectory.

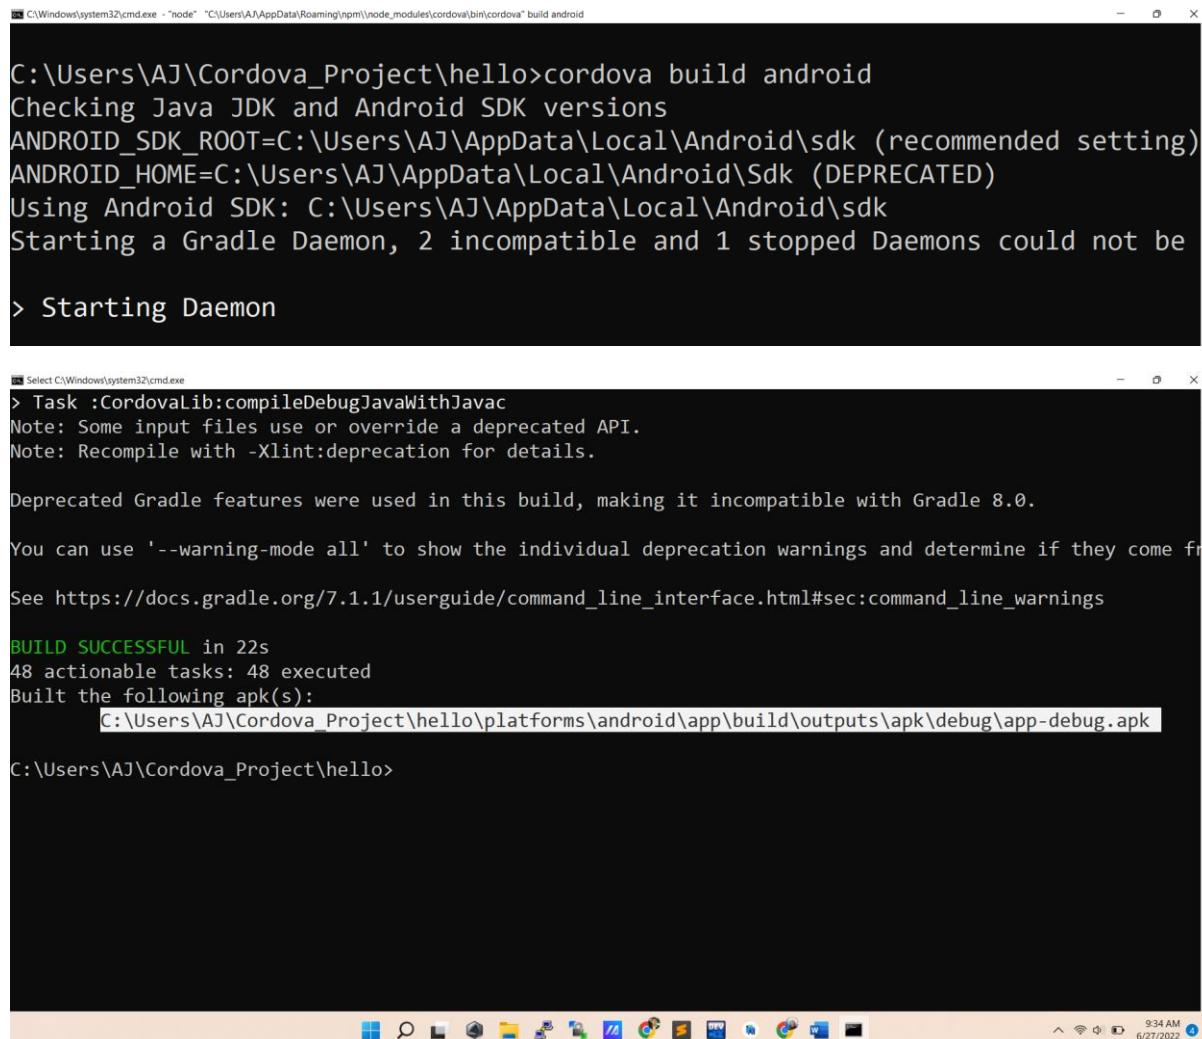

Note: When using the CLI to build your application, you should *not* edit any files in the */platforms/* directory. The files in this directory are routinely overwritten when preparing applications for building, or when plugins are re-installed.

Build the App

By default, `cordova create` script generates a skeletal web-based application whose start page is the project's `www/index.html` file. Any initialization should be specified as part of the `deviceready` event handler defined in `www/js/index.js`.

Run the following command to build the project for *all* platforms:

```
$ cordova build
```

The image shows two separate command-line windows side-by-side. The left window is titled 'C:\Windows\system32\cmd.exe' and displays the output of the command 'cordova build android'. It shows the path 'C:\Users\AJ\Cordova_Project\hello>', followed by the command, and then a series of logs about Java JDK and Android SDK versions, including environment variables like ANDROID_SDK_ROOT and ANDROID_HOME, and a message about starting a Gradle Daemon. The right window is also titled 'C:\Windows\system32\cmd.exe' and displays the output of 'cordova build ios'. It shows the path 'C:\Users\AJ\Cordova_Project\hello>', followed by the command, and then a series of logs about Java and Gradle, including deprecation warnings and a successful build message indicating an apk was built at 'C:\Users\AJ\Cordova_Project\hello\platforms\android\app\build\outputs\apk\debug\app-debug.apk'. Both windows have standard Windows taskbar icons at the bottom.

```
C:\Windows\system32\cmd.exe - "node" "C:\Users\AJ\AppData\Roaming\npm\node_modules\cordova\bin\cordova" build android
C:\Users\AJ\Cordova_Project\hello>cordova build android
Checking Java JDK and Android SDK versions
ANDROID_SDK_ROOT=C:\Users\AJ\AppData\Local\Android\sdk (recommended setting)
ANDROID_HOME=C:\Users\AJ\AppData\Local\Android\Sdk (DEPRECATED)
Using Android SDK: C:\Users\AJ\AppData\Local\Android\sdk
Starting a Gradle Daemon, 2 incompatible and 1 stopped Daemons could not be
> Starting Daemon

Select C:\Windows\system32\cmd.exe
> Task :CordovaLib:compileDebugJavaWithJavac
Note: Some input files use or override a deprecated API.
Note: Recompile with -Xlint:deprecation for details.

Deprecated Gradle features were used in this build, making it incompatible with Gradle 8.0.

You can use '--warning-mode all' to show the individual deprecation warnings and determine if they come from
See https://docs.gradle.org/7.1.1/userguide/command_line_interface.html#sec:command_line_warnings

BUILD SUCCESSFUL in 22s
48 actionable tasks: 48 executed
Built the following apk(s):
    C:\Users\AJ\Cordova_Project\hello\platforms\android\app\build\outputs\apk\debug\app-debug.apk

C:\Users\AJ\Cordova_Project\hello>
```

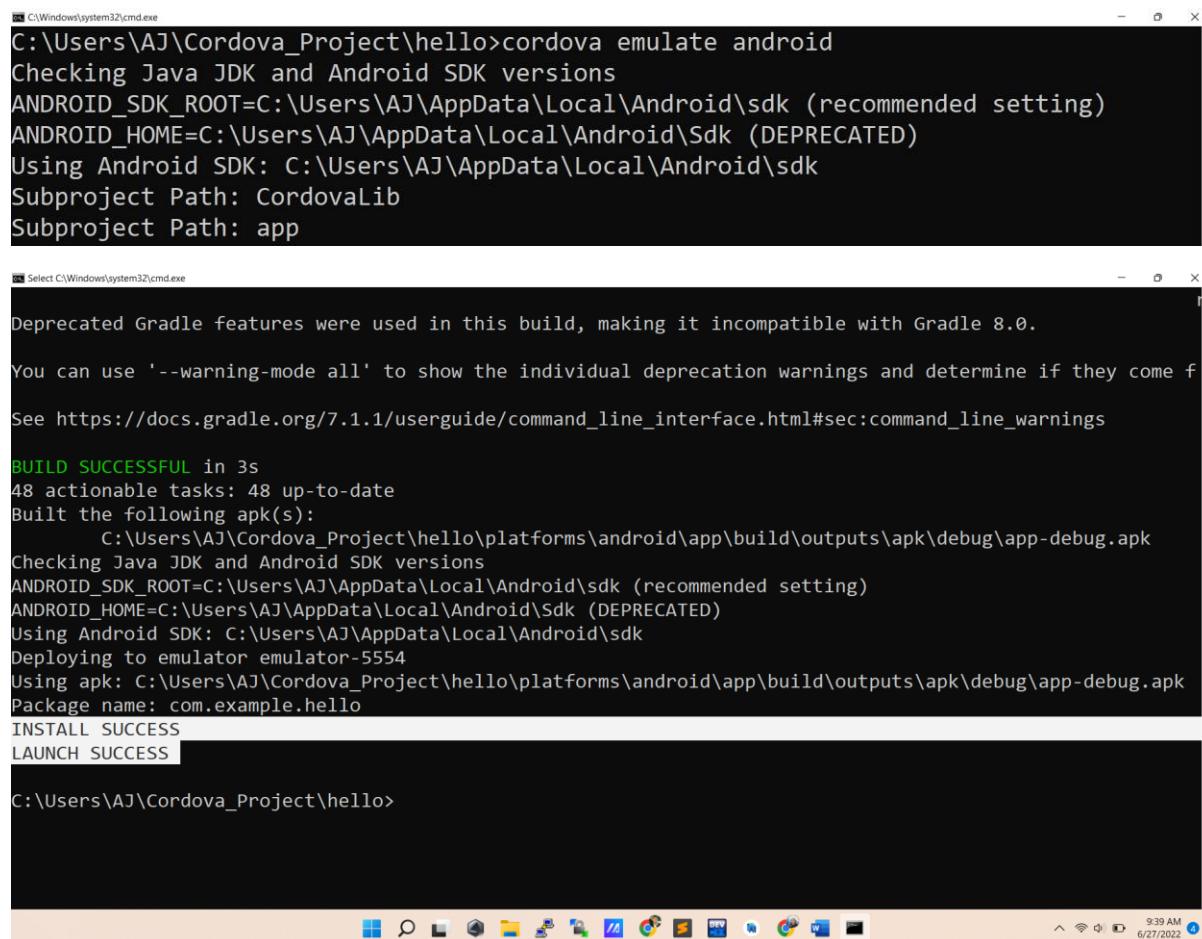

You can optionally limit the scope of each build to specific platforms - 'ios' in this case:

```
$ cordova build ios
```

Test the App

SDKs for mobile platforms often come bundled with emulators that execute a device image, so that you can launch the app from the home screen and see how it interacts with many platform features. Run a command such as the following to rebuild the app and view it within a specific platform's emulator:

```
$ cordova emulate android
```

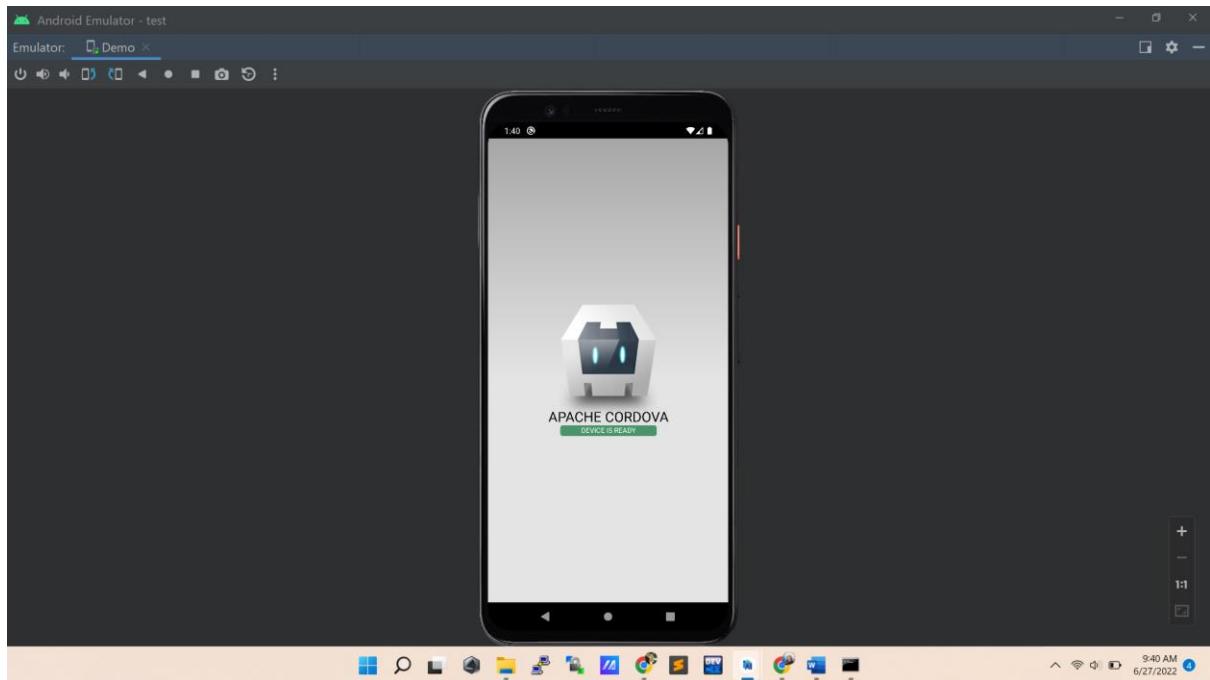

The image shows three stacked Windows Command Prompt windows. The top window shows the command being run: '\$ cordova emulate android'. The middle window displays the build process, including Java/JDK and Android SDK checks, and the creation of an APK file named 'app-debug.apk'. The bottom window shows the launch of the app on an emulator, with the message 'LAUNCH SUCCESS'.

```
C:\Users\AJ\Cordova_Project\hello>cordova emulate android
Checking Java JDK and Android SDK versions
ANDROID_SDK_ROOT=C:\Users\AJ\AppData\Local\Android\sdk (recommended setting)
ANDROID_HOME=C:\Users\AJ\AppData\Local\Android\Sdk (DEPRECATED)
Using Android SDK: C:\Users\AJ\AppData\Local\Android\sdk
Subproject Path: CordovaLib
Subproject Path: app

Select C:\Windows\system32\cmd.exe
Deprecated Gradle features were used in this build, making it incompatible with Gradle 8.0.
You can use '--warning-mode all' to show the individual deprecation warnings and determine if they come from
See https://docs.gradle.org/7.1.1/userguide/command_line_interface.html#sec:command_line_warnings

BUILD SUCCESSFUL in 3s
48 actionable tasks: 48 up-to-date
Built the following apk(s):
    C:\Users\AJ\Cordova_Project\hello\platforms\android\app\build\outputs\apk\debug\app-debug.apk
Checking Java JDK and Android SDK versions
ANDROID_SDK_ROOT=C:\Users\AJ\AppData\Local\Android\sdk (recommended setting)
ANDROID_HOME=C:\Users\AJ\AppData\Local\Android\Sdk (DEPRECATED)
Using Android SDK: C:\Users\AJ\AppData\Local\Android\sdk
Deploying to emulator emulator-5554
Using apk: C:\Users\AJ\Cordova_Project\hello\platforms\android\app\build\outputs\apk\debug\app-debug.apk
Package name: com.example.hello
INSTALL SUCCESS
LAUNCH SUCCESS

C:\Users\AJ\Cordova_Project\hello>
```

See Android's documentation on [Create your first Cordova app](#) for more details.

3. Converting Website to Mobile App

1. Creating a cordova project.

Open the command prompt (command + r) or any CLI tool and go the path where you want to create new cordova project.

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.19042.928]
(c) Microsoft Corporation. All rights reserved.

C:\Users\AJ>cd Cordova_Project

C:\Users\AJ\Cordova_Project>
```

Type the following command:

```
cordova create project_directory_name package_name app_title
```

Example:

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.19042.928]
(c) Microsoft Corporation. All rights reserved.

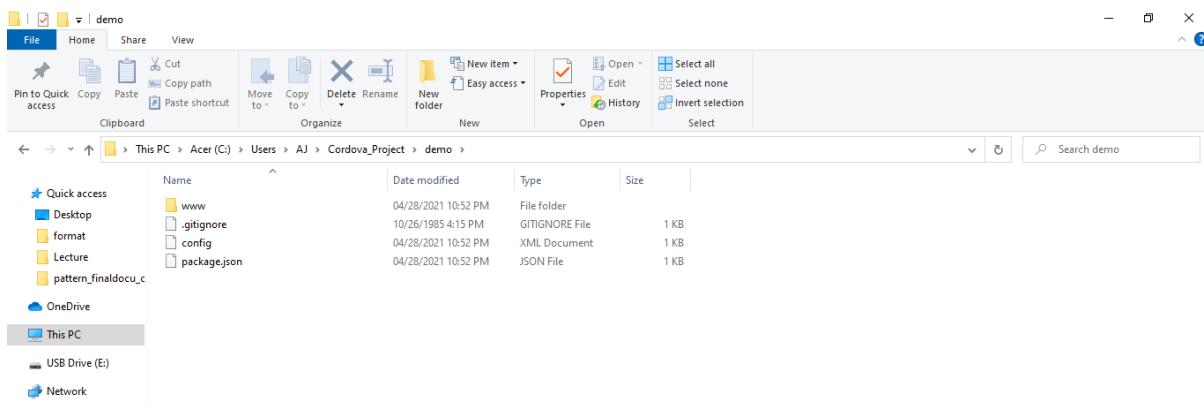

C:\Users\AJ>cd Cordova_Project

C:\Users\AJ\Cordova_Project>cordova create demo com.example.myapp MyAppName
Creating a new cordova project.
```

```
cordova create directory-name com.example.myapp MyAppName
```

The create command has three parameters: the first specifies the **folder** where the solution will be created, the second is a **reverse domain-style identifier** which must be unique, and the last one is the **application display name**.

Once it's done, it will create a directory structure like this:

2. Add platform to project.

Once you create project add platform to project using the following command: (**Note:** Before you add a platform, make sure that you are in your project directory.)

```
cordova platform add <platform>
```

Example:

```
C:\WINDOWS\system32\cmd.exe

C:\Users\AJ\Cordova_Project\demo>cordova platform add android
Using cordova-fetch for cordova-android@^9.0.0
Adding android project...
Creating Cordova project for the Android platform:
  Path: platforms\android
  Package: com.example.myapp
  Name: MyAppName
  Activity: MainActivity
  Android target: android-29
Subproject Path: CordovaLib
Subproject Path: app
Android project created with cordova-android@9.1.0
Discovered plugin "cordova-plugin-whitelist". Adding it to the project
Installing "cordova-plugin-whitelist" for android
Adding cordova-plugin-whitelist to package.json
```

Example: (Select the platform where you want to build your app.)

```
cordova platform add ios OR cordova platform add android
```

Type following command to check if all requirements are configured and installed properly:

```
cordova requirements
```

Example:

```
C:\> C:\WINDOWS\system32\cmd.exe  
C:\Users\AJ\Cordova_Project\demo>cordova requirements  
  
Requirements check results for android:  
Java JDK: installed 1.8.0  
Android SDK: installed true  
Android target: installed android-30,android-29,android-28,android-27  
Gradle: installed C:\Gradle\gradle-6.8.3\bin\gradle.BAT
```

3. Install necessary plug-ins.

Install any plugins you may need using the following command: (Example: Dialog Box, Check Network Connectivity, and Web View Functionality.)

Sample Plugin:

cordova-plugin-inappbrowser

cordova-plugin-dialogs

cordova-plugin-network-information

```
Cordova plugin add plug-in-name
```

Example:

```
C:\Users\AJ\Cordova_Project\demo>cordova plugin add cordova-plugin-dialogs
Installing "cordova-plugin-dialogs" for android
Adding cordova-plugin-dialogs to package.json

C:\Users\AJ\Cordova_Project\demo>cordova plugin add cordova-plugin-inappbrowser
Installing "cordova-plugin-inappbrowser" for android
Adding cordova-plugin-inappbrowser to package.json

C:\Users\AJ\Cordova_Project\demo>cordova plugin add cordova-plugin-network-information
Installing "cordova-plugin-network-information" for android
Adding cordova-plugin-network-information to package.json
```

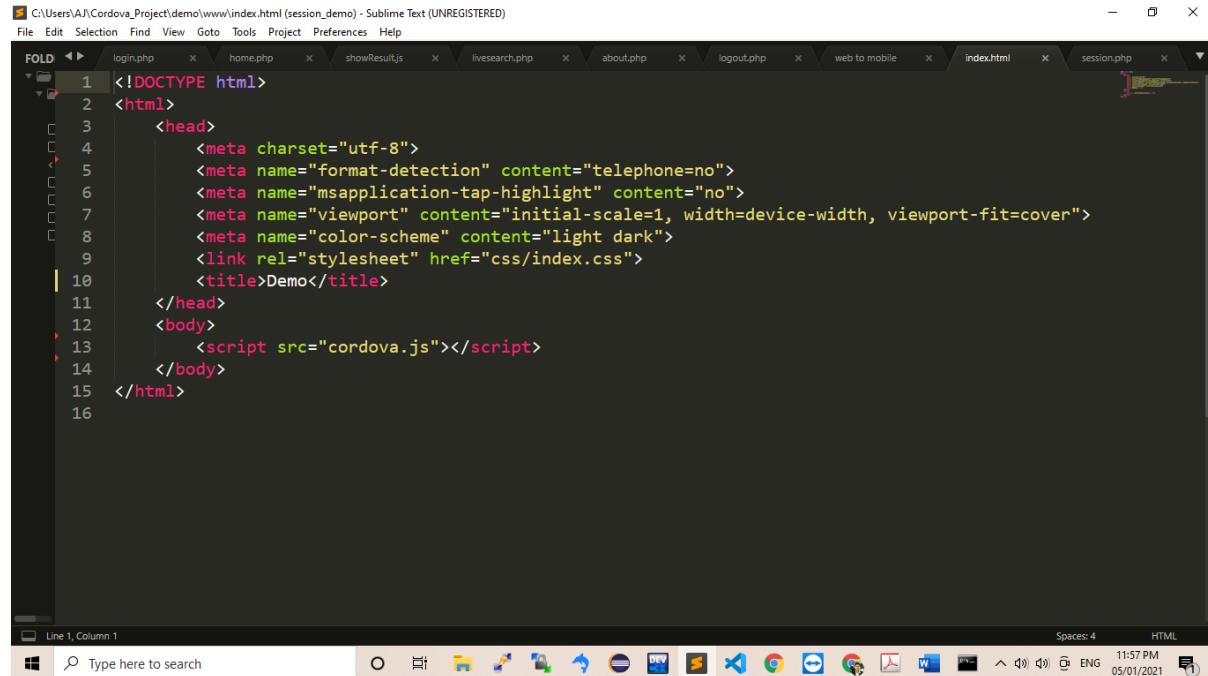

Click this [link](#) for complete cordova plugin information/commands.

www: (required) this directory contains the html, javascript and other assets that should be included in your application. This directory should contain a file called index.html that is the HTML root of your application.

4. Build the App.

By default, cordova create script generates a skeletal web-based application whose start page is the project's **www/index.html** file. Any initialization should be specified as part of the deviceready event handler defined in **www/js/index.js**

1. From your project directory, go to /www and open the *index.html* file. Remove unnecessary code meta tag/commentary/license information and retain *cordova.js* file.

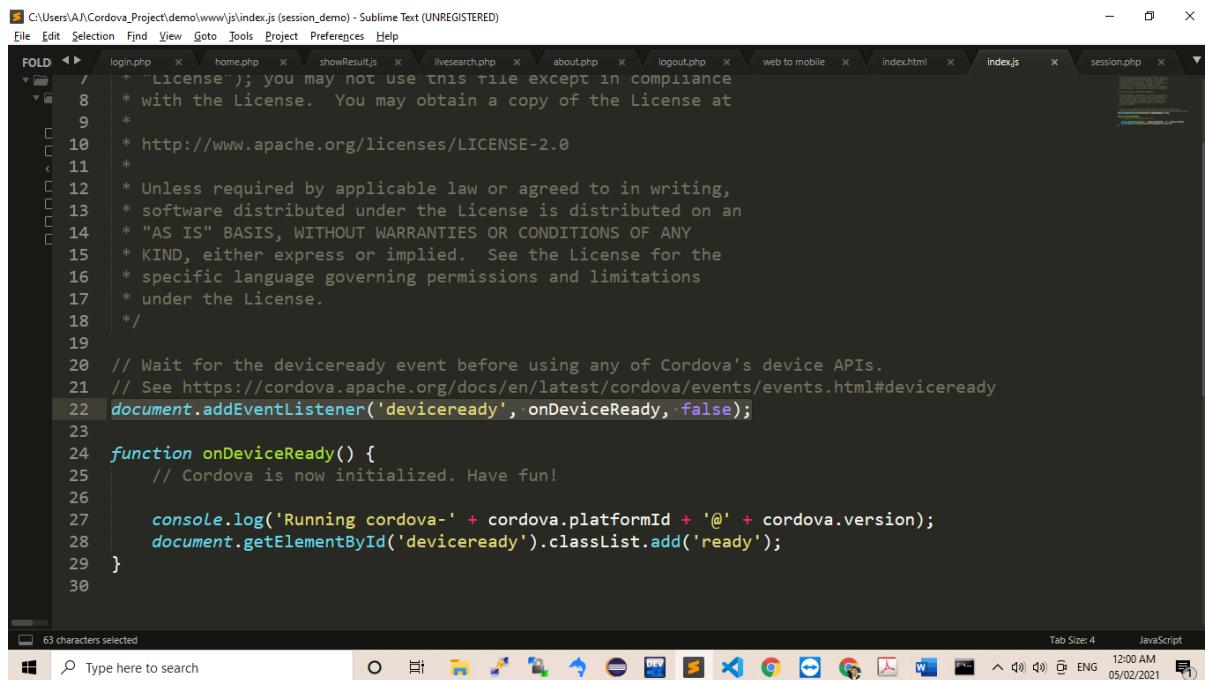

The screenshot shows a Sublime Text window with multiple tabs at the top: login.php, home.php, showResult.js, liveSearch.php, about.php, logout.php, web to mobile, index.html, and session.php. The index.html tab is active, displaying the following HTML code:

```
1 <!DOCTYPE html>
2 <html>
3     <head>
4         <meta charset="utf-8">
5         <meta name="format-detection" content="telephone=no">
6         <meta name="msapplication-tap-highlight" content="no">
7         <meta name="viewport" content="initial-scale=1, width=device-width, viewport-fit=cover">
8         <meta name="color-scheme" content="light dark">
9         <link rel="stylesheet" href="css/index.css">
10        <title>Demo</title>
11    </head>
12    <body>
13        <script src="cordova.js"></script>
14    </body>
15 </html>
```

The status bar at the bottom indicates "Line 1, Column 1" and "Spaces: 4 HTML". The taskbar at the bottom shows various icons for Windows applications like File Explorer, Task View, and Start.

2. Go to `www/js` directory and open the `index.js` file. Look and copy device ready event.

The screenshot shows a Sublime Text window with multiple tabs open, including `login.php`, `home.php`, `showResults.js`, `liveSearch.php`, `about.php`, `logout.php`, `web to mobile`, `index.html`, `index.js`, and `session.php`. The `index.js` tab is active and displays the following code:

```
/ * The Apache Software License, Version 2.0 * License); you may not use this file except in compliance * with the License. You may obtain a copy of the License at * http://www.apache.org/licenses/LICENSE-2.0 * Unless required by applicable law or agreed to in writing, * software distributed under the License is distributed on an * "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY * KIND, either express or implied. See the License for the * specific language governing permissions and limitations * under the License. */ // Wait for the deviceready event before using any of Cordova's device APIs. // See https://cordova.apache.org/docs/en/latest/cordova/events/events.html#deviceready document.addEventListener('deviceready', onDeviceReady, false); function onDeviceReady() { // Cordova is now initialized. Have fun! console.log('Running cordova-' + cordova.platformId + '@' + cordova.version); document.getElementById('deviceready').classList.add('ready'); }
```

The status bar at the bottom indicates "63 characters selected". The taskbar below the window shows various pinned icons for Windows applications like File Explorer, Task View, and Edge.

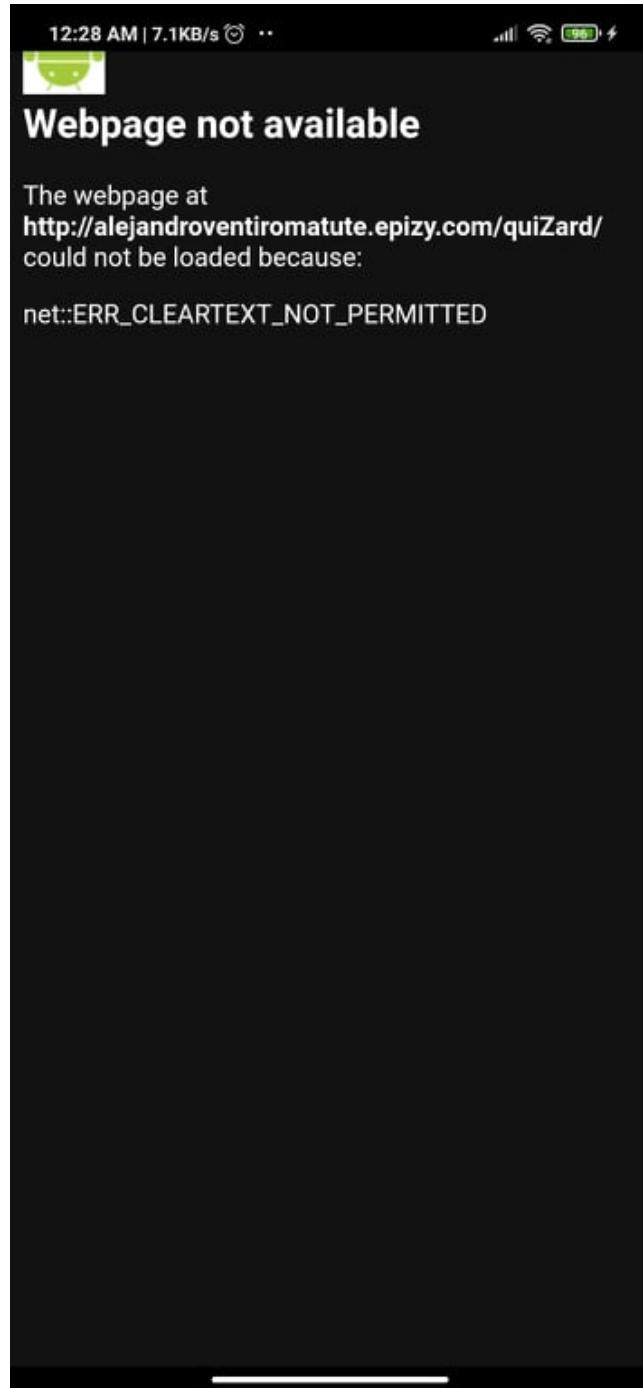

3. Go back to `www/index.html` file and create an External JavaScript tag below the existing `<script>` tag. Inside of the new created External JavaScript tag, and paste the device ready event. Do the following code below: (Set the `url` of your website as the first parameter of the `cordova.InAppBrowser.open()` function.)

Index.html

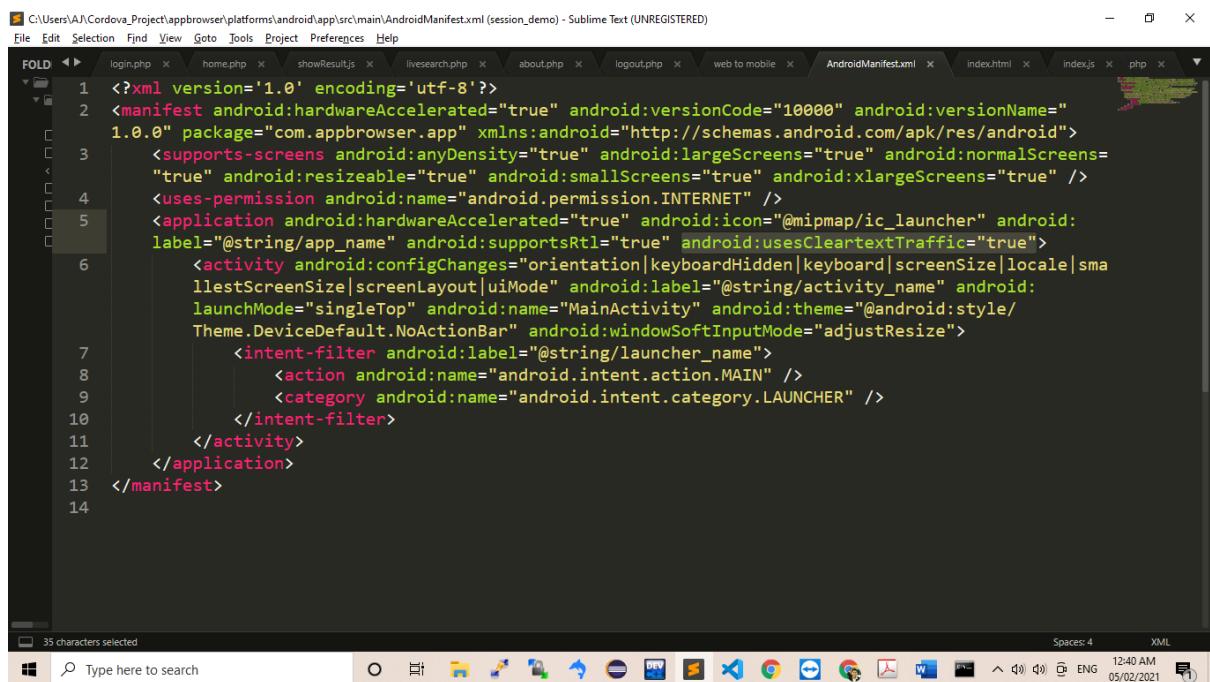

```
<!DOCTYPE html>
<html>
<head>
<meta charset="utf-8">
<meta name="format-detection" content="telephone=no">
<meta name="msapplication-tap-highlight" content="no">
<meta name="viewport" content="width=device-width, initial-scale=1.0, minimum-scale=1.0, maximum-scale=1.0, user-scalable=no, viewport-fit=cover"/>
<meta name="color-scheme" content="light dark">
<link rel="stylesheet" href="css/index.css">
<title>Demo</title>
</head>
```

```
<body>
<script src="cordova.js"></script>
<script type="text/javascript">
    document.addEventListener('deviceready', function(){
        cordova.InAppBrowser.open('http://alejandroventiromatute.epizy.com/e-
learning/', '_blank', 'location=no, zoom=no, toolbar=no');
    });
</script>
</body>
</html>
```

4. From your project directory, go to platforms/android/app/src/main and look for **AndroidManifest.xml** file. Open the file and add the following code after the **android:supportsRtl="true"** like the example below, which will resolve this error '**net::ERR_NAME_NOT_RESOLVED**':

```
        android:usesCleartextTraffic="true"
```

The screenshot shows a Sublime Text window with multiple tabs open, including login.php, home.php, showResult.js, liveSearch.php, about.php, logout.php, web to mobile, AndroidManifest.xml (the current tab), index.html, index.js, and php. The AndroidManifest.xml tab displays the XML code for the manifest file. A specific line has been highlighted with a red rectangle:

```
<uses-permission android:name="android.permission.INTERNET" />
```

This line adds the `usesCleartextTraffic` attribute to the `application` tag.

Build Cordova on android/ios platform using the following command:

```
cordova build android
```

OR

```
cordova build ios
```

Example: (You should something like this in your CLI)

```
C:\ C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.19042.928]
(c) Microsoft Corporation. All rights reserved.

C:\Users\AJ>cd Cordova_Project
C:\Users\AJ\Cordova_Project>cd demo

C:\Users\AJ\Cordova_Project\demo>cordova build android
Checking Java JDK and Android SDK versions
ANDROID_SDK_ROOT=undefined (recommended setting)
ANDROID_HOME=C:\Users\AJ\AppData\Local\Android\Sdk (DEPRECATED)
Using Android SDK: C:\Users\AJ\AppData\Local\Android\Sdk
Starting a Gradle Daemon, 1 incompatible and 1 stopped Daemons could not be reused, use --status for details

> IDLE

BUILD SUCCESSFUL in 43s
1 actionable task: 1 executed
Subproject Path: CordovaLib
Subproject Path: app
Starting a Gradle Daemon, 1 incompatible Daemon could not be reused, use --status for details

> Task :app:compileDebugJavaWithJavac
Note: Some input files use or override a deprecated API.
Note: Recompile with -Xlint:deprecation for details.

Deprecated Gradle features were used in this build, making it incompatible with Gradle 7.0.
Use '--warning-mode all' to show the individual deprecation warnings.
See https://docs.gradle.org/6.5/userguide/command_line_interface.html#sec:command_line_warnings

BUILD SUCCESSFUL in 1m 19s
40 actionable tasks: 40 executed
Built the following apk(s):
    C:\Users\AJ\Cordova_Project\demo\platforms\android\app\build\outputs\apk\debug\app-debug.apk
```

Go to the directory to see and test your apk file.

Example:

C:\Users\AJ\Cordova_Project\demo\platforms\android\app\build\outputs\apk\debug\app-debug.apk

5. Add App Icon

Provide any icon you want for your app. Resize your app icon to all needed resolutions. You may use any online app resizer such as resizeappicon.com.

From your project directory, create /res folder to store the values for the resources (images, etc.).

Example:

C:\Users\AJ\Cordova_Project\demo\res\images

Copy and Paste the code below into the config.xml file. (The config.xml file is located in the project directory.)

```
<platform name="android">
  <allow-intent href="market:*>
  <icon density="ldpi" src="res/images/ldpi.png" />
  <icon density="mdpi" src="res/images/mdpi.png" />
  <icon density="hdpi" src="res/images/hdpi.png" />
  <icon density="xhdpi" src="res/images/xhdpi.png" />
  <icon density="xxhdpi" src="res/images/xxhdpi.png" />
  <icon density="xxxhdpi" src="res/images/xxxhdpi.png" />
</platform>
```

6. Add splashscreen

To add splashscreen, install cordova splashscreen plugin.

```
cordova plugin add cordova-plugin-splashscreen
```

Example:

```
C:\WINDOWS\system32\cmd.exe  
C:\Users\AJ\Cordova_Project\demo>cordova plugin add cordova-plugin-splashscreen  
Installing "cordova-plugin-splashscreen" for android  
Adding cordova-plugin-splashscreen to package.json
```

Platform Splash Screen Image Configuration

Directory structure:

```
projectRoot
    node_modules

    platforms
        android
            app
                src
                    main
                    res
    plugins
    res
    www
```

Splash Screens for the Android Platform

Place 9-patch image files in the Android project's directories.

The size for each should be:

- **xlarge (xhdpi)**: at least 960 × 720
- **large (hdpi)**: at least 640 × 480
- **medium (mdpi)**: at least 470 × 320
- **small (ldpi)**: at least 426 × 320

Example: C:\Users\AJ\Cordova_Project\demo\platforms\android\app\src\main\res

Default Cordova Screen

Location: YourProjectDirectory\platforms\android\app\src\main\res\drawable-port-hdpi

Copy and Paste the code below into the config.xml file. (The config.xml file is located in the project directory.)

```
<platform name="android">
    <preference name="SplashScreen" value="elearning" />
    <preference name="SplashScreenDelay" value="10000" />
    <preference name="ShowSplashScreenSpinner" value="true" />
    <preference name="SplashScreenSpinnerColor" value="blue" />
</platform>
```

For complete Icons and Splash Screens reference, click [here](#).

4. Running Cordova Application

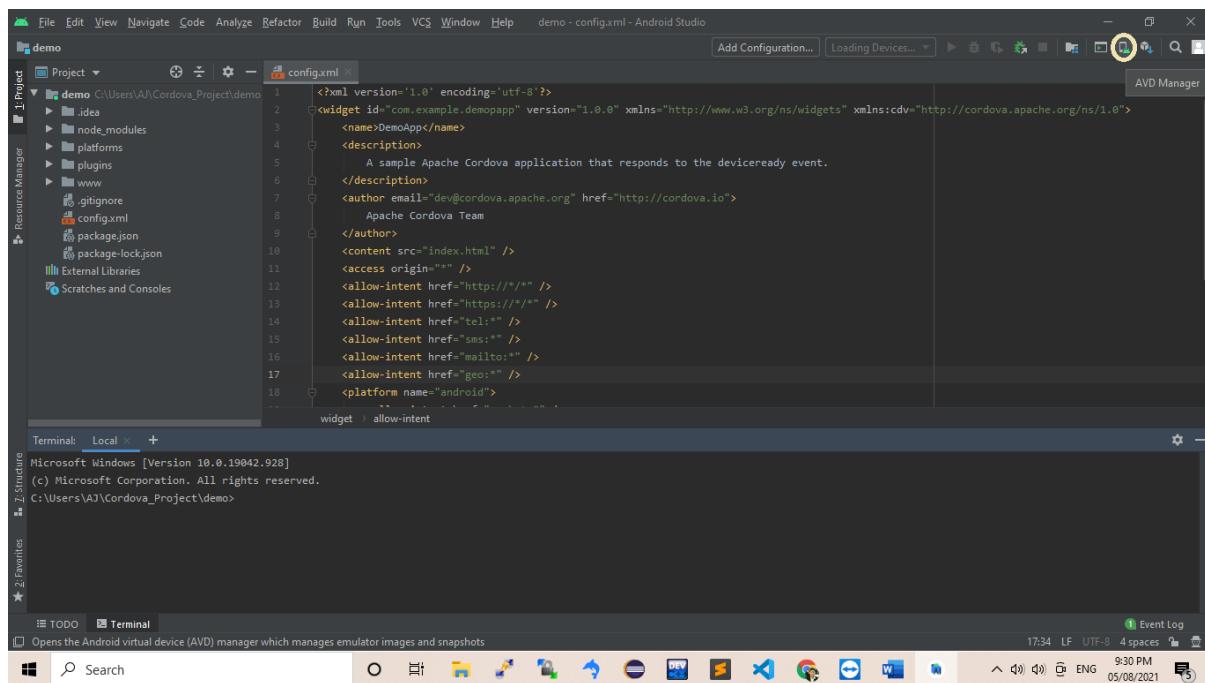

Option 1: Using Android Emulator

Option 2: Running on Actual Device

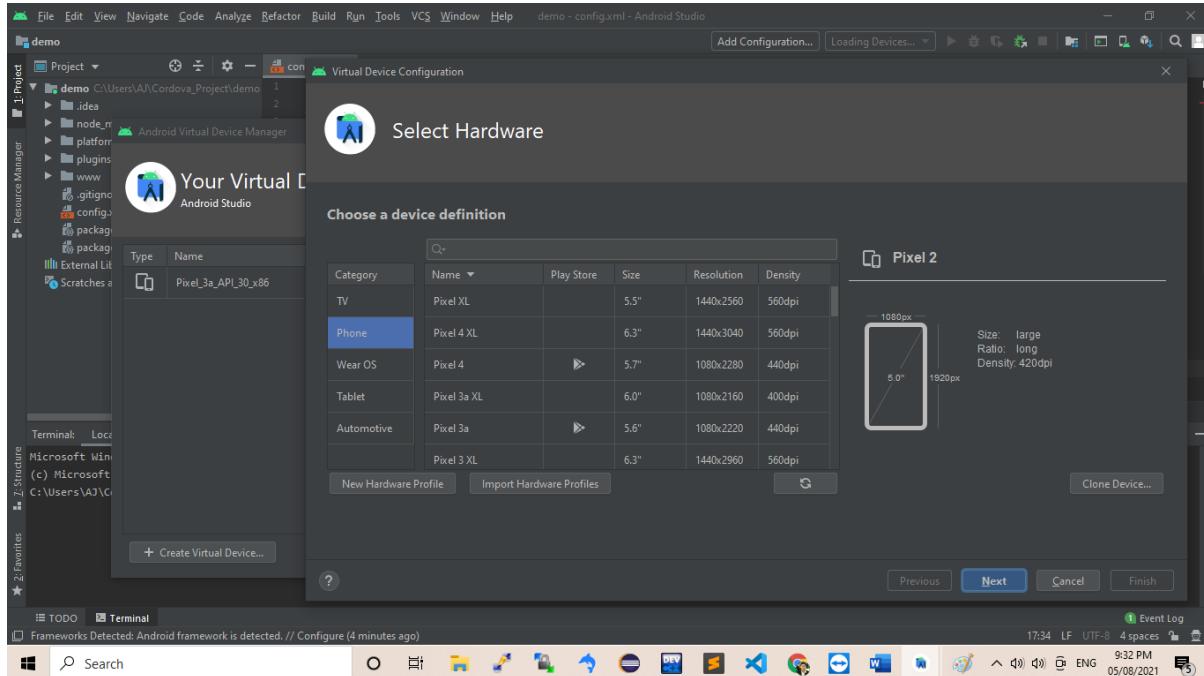

Option 1: Using Android Emulator

Step 1: Run Android Studio

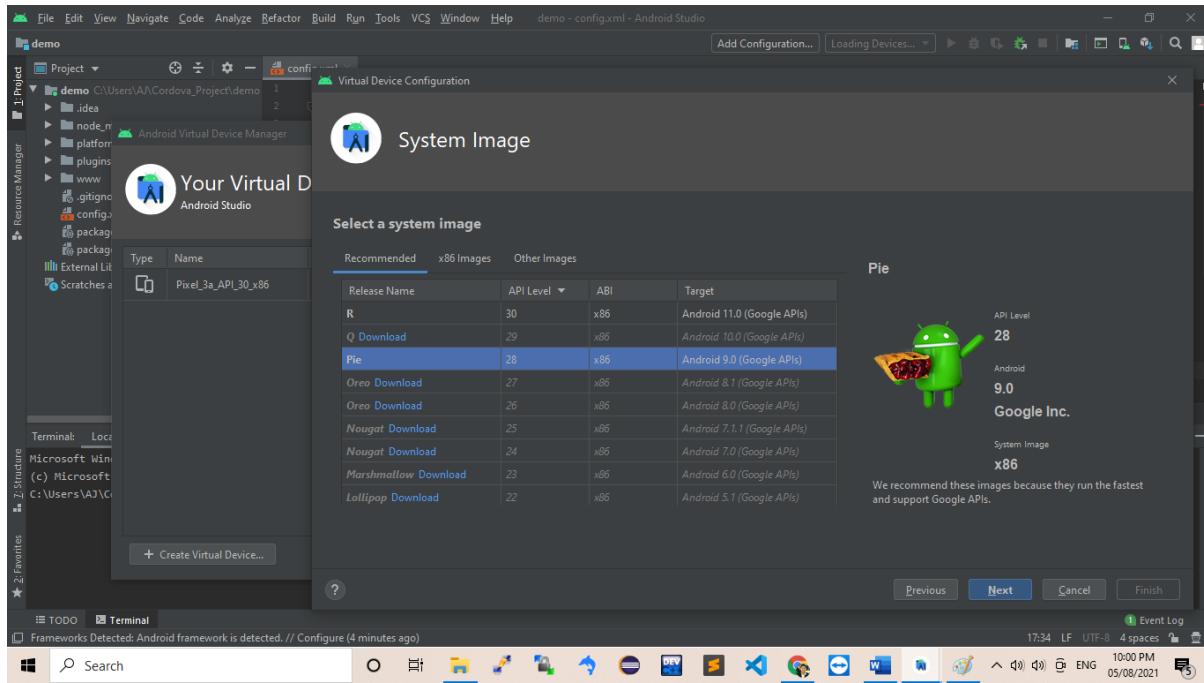

Step 2: Locate Android Virtual Device (AVD) Manager

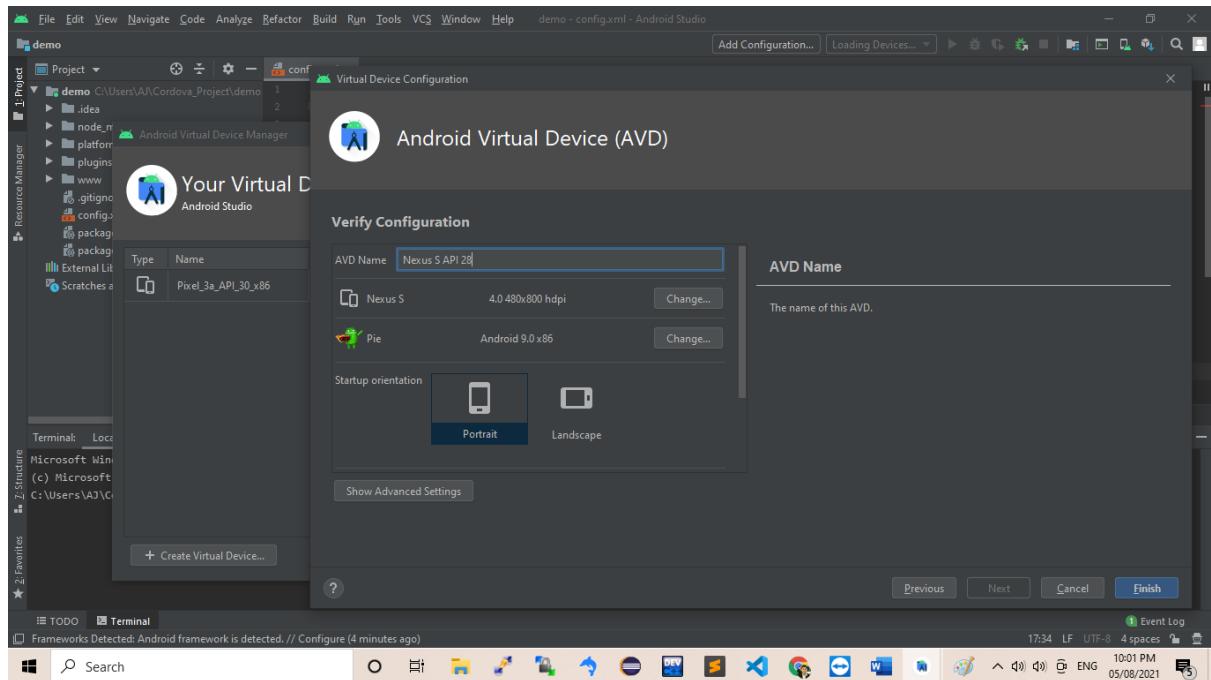

Step 3: Create Virtual Device based on your own preference. Choose a device definition.

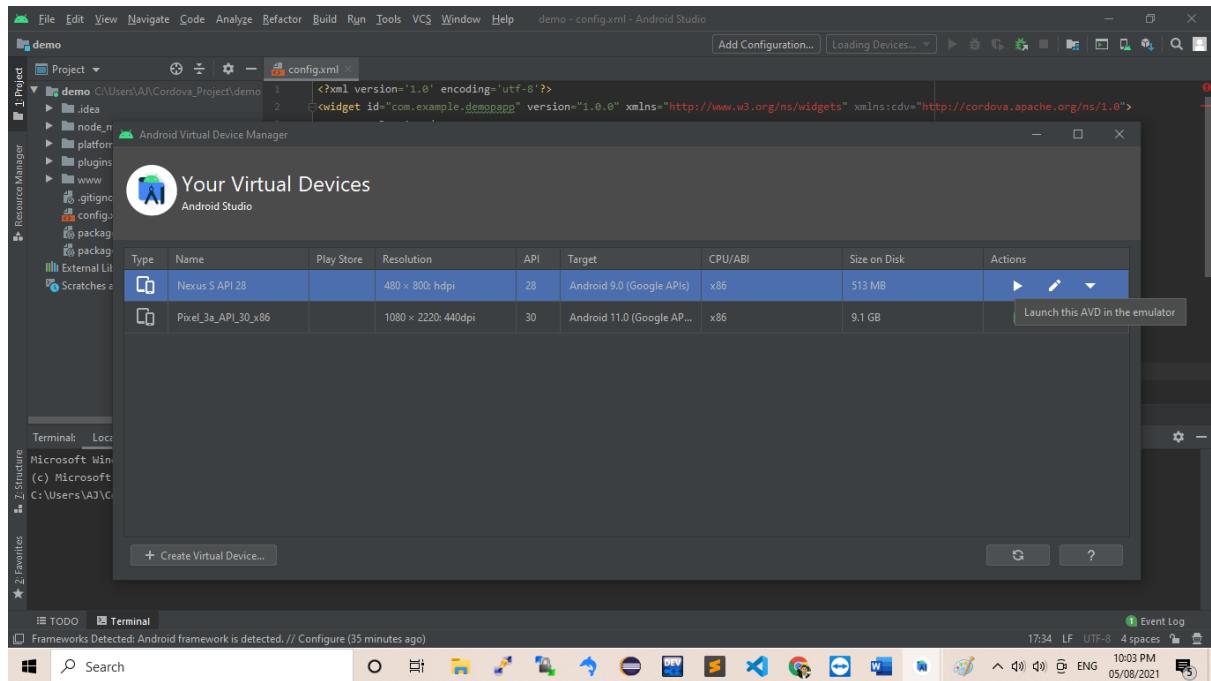

Step 4: Select a system image.

Step 5: Verify Configuration.

Step 6: Select and Launch the AVD in the Emulator

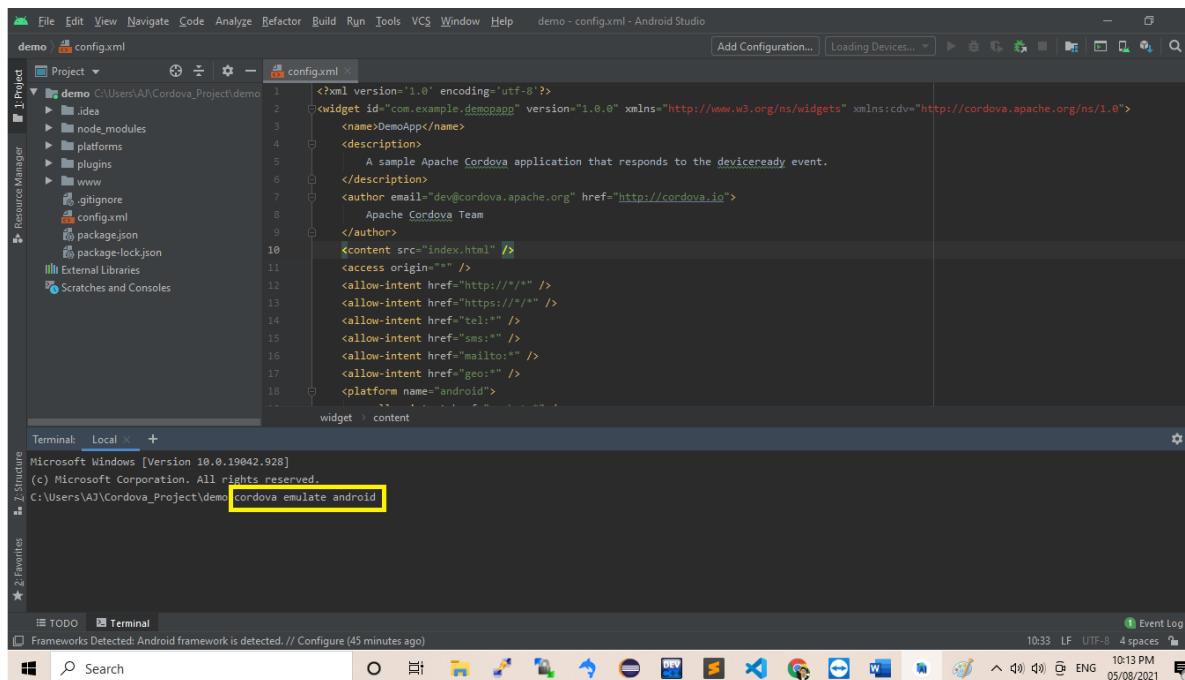

Step 7: Deploy to Emulator

Use the cordova CLI utility to deploy the application to the emulator from the command line:

```
cordova emulate android
```

Example:

Option 2: Running on Actual Device

Step 1: Connect your mobile device to your machine (pc or laptop).

Step 2: In your Mobile Device, go to ‘Settings’, Find and Tap ‘**About Phone**’.

Step 3: Look for ‘Build Number’ or ‘MIUI version’ and Tap it 7 times until it says, “**You are now a Developer!**”.

Step 4: Go back to settings and now you will see the ‘**Developer Options**’ or go to **Additional Settings** and look for ‘**Developer Options**’. Enable ‘**Developer Options**’.

Step 5: In developer options, you should be able to see ‘USB debugging’. **Enable** or **Allow** ‘USB debugging’.

Step 6: Go back to your machine (pc or laptop), specifically to command prompt or Terminal. In your cmd or terminal, type the following command to check if your mobile device is properly connected: (check devices)

```
adb devices
```

Example:

```
C:\WINDOWS\system32\cmd.exe
```

```
C:\Users\AJ\Cordova_Project\demo>adb devices
List of devices attached
e12a90cb        device
```

Step 7: In your project directory (cmd or terminal), type the following command to run your output. (In this case, APK file):

```
cordova run android --device
```

Example:

```
C:\ C:\WINDOWS\system32\cmd.exe

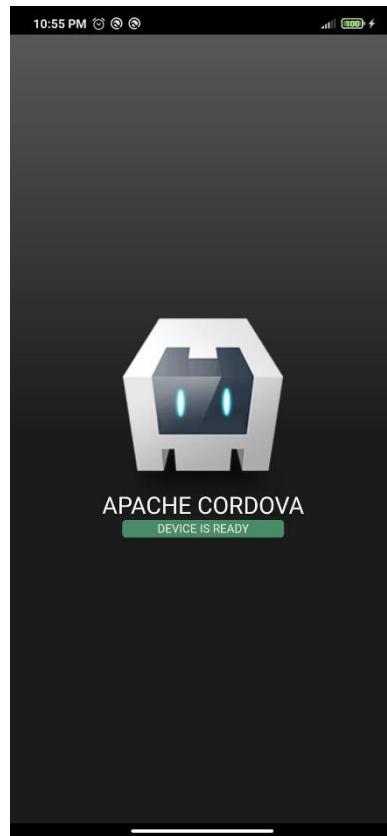

C:\Users\AJ\Cordova_Project\demo>adb devices
List of devices attached
e12a90cb        device

C:\Users\AJ\Cordova_Project\demo>cordova run android --device
Checking Java JDK and Android SDK versions
ANDROID_SDK_ROOT=undefined (recommended setting)
ANDROID_HOME=C:\Users\AJ\AppData\Local\Android\Sdk (DEPRECATED)
Using Android SDK: C:\Users\AJ\AppData\Local\Android\Sdk
Subproject Path: Cordovalib
Subproject Path: app

Deprecated Gradle features were used in this build, making it incompatible with Gradle 7.0.
Use '--warning-mode all' to show the individual deprecation warnings.
See https://docs.gradle.org/6.5/userguide/command_line_interface.html#sec:command_line_warnings

BUILD SUCCESSFUL in 32s
40 actionable tasks: 40 up-to-date
Built the following apk(s):
    C:\Users\AJ\Cordova_Project\demo\platforms\android\app\build\outputs\apk\debug\app-debug.apk
Checking Java JDK and Android SDK versions
ANDROID_SDK_ROOT=C:\Users\AJ\AppData\Local\Android\Sdk (recommended setting)
ANDROID_HOME=C:\Users\AJ\AppData\Local\Android\Sdk (DEPRECATED)
Using Android SDK: C:\Users\AJ\AppData\Local\Android\Sdk
Deploying to device e12a90cb
Using apk: C:\Users\AJ\Cordova_Project\demo\platforms\android\app\build\outputs\apk\debug\app-debug.apk
Package name: com.example.myapp
INSTALL SUCCESS
LAUNCH SUCCESS
```

****You should be able to see the output in your mobile device:** (Device Ready)

***Note:** If there is a problem/error connecting, make sure you check on any of the following:

1. Turn Off/On "system optimization" or "device optimization" and Restart your device.
2. Turn On "USB Debugging".
3. Turn On "Install via USB" (Need to connect to network).
4. Set USB Configuration to Charging.
5. Turn On "install via USB (Need to connect to network)".
